simulation experimental validation and parametric optimization of an air filled Beta type Stirling refrigerator for domestic application The research shows that a non ideal second order numerical model called the modified simple model has been developed The model incorporates effects of shuttle heat loss and mass leakage loss to the buffer space directly to the differential equations of pressure change rate of change of mass of gas in compression and expansion spaces and mass flow rates across these working spaces Moreover other power losses and heat losses are included as independent losses to evaluate the cooling production and associated COP The model is simulated using MATLAB code for Beta configuration FEMTO 60 Stirling engine operating as a refrigerator The model is validated both with an experiment conducted in the FEMTO ST laboratory in refrigerating mode and by reversing the model to work producing engine so that the validation could be made with different theoretical models developed by other scholars so far The validation results confirm that the proposed numerical model could be used to design a Stirling cycle refrigerating machine with reasonable accuracy The contribution of this study also includes investigation of the effect of different working fluids air nitrogen hydrogen and helium effects of losses shuttle heat and mass leakage that have a direct effect on the operating condition of the cooling machine and parametric optimization Air and nitrogen showed better cooling performance than helium and hydrogen mainly due to the higher mass flow rate The effects of incorporating shuttle heat loss in the differential equations on the temperature and pressure of working gas and the overall performance of the Stirling refrigerator are analyzed Parametric optimization includes the effect of operating rotational speed charging pressure and temperature and geometrical phase angle regenerator length porosity displacer height displacer gap piston cylinder clearance gap swept volume ratio and piston diameter to stroke ratio parameters on the cooling performance as well as on share of different power and heat losses Finally we propose a set of parameters to optimize a refrigerating Stirling machine achieving a COP of 1.3 for a cooling power of 625 W at a temperature of 4 C

Marquez,2019-04-07 Generating code from MATLAB algorithms for desktop and embedded systems allows you to perform your software design implementation and testing completely within the MATLAB workspace You can Verify that your algorithms are suitable for code generation Generate efficient readable and compact C C code automatically which eliminates the need to manually translate your MATLAB algorithms and minimizes the risk of introducing errors in the code Modify your design in MATLAB code to take into account the specific requirements of desktop and embedded applications such as data type management memory use and speed Test the generated code and easily verify that your modified algorithms are functionally equivalent to your original MATLAB algorithms Generate MEX functions to Accelerate MATLAB algorithms in certain applications Speed up fixed poin MATLAB code Generate hardware description language HDL from MATLAB code To generate C C or MEX code from MATLAB algorithms you must install the following software MATLAB Coder product C C compiler When writing MATLAB code that you want to convert into efficient standalone C C code you must

consider the following Data types C and C use static typing To determine the types of your variables before use MATLAB Coder requires a complete assignment to each variable Array sizing Variable size arrays and matrices are supported for code generation You can define inputs outputs and local variables in MATLAB functions to represent data that varies in size at run time Memory You can choose whether the generated code uses static or dynamic memory allocation With dynamic memory allocation you potentially use less memory at the expense of time to manage the memory With static memory you get better speed but with higher memory usage Most MATLAB code takes advantage of the dynamic sizing features in MATLAB therefore dynamic memory allocation typically enables you to generate code from existing MATLAB code without modifying it much Dynamic memory allocation also allows some programs to compile even when upper bounds cannot be found Static allocation reduces the memory footprint of the generated code and therefore issuitable for applications where there is a limited amount of available memory such asembled applications
