Traveling Salesman Gerhard Reinelt,2003-08-02 Still today I am receiving requests for reprints of the book but unfortunately it is out of print Therefore since the book still seems to receive some attention I p posed to Springer Verlag to

provide a free online edition I am very happy that Springer agreed Except for the correction of some typographical errors the online edition is just a copy of the printed version no updates have been made In particular Table 13.1 gives the status of TSPLIB at the time of publishing the book For accessing TSPLIB the link <http://www.iwr.uni-heidelberg.de/iwr/comopt> software TSPLIB95 should be used instead of following the procedure described in Chapter 13 Heidelberg January 2001 Gerhard Reinelt Preface More than fifteen years ago I was faced with the following problem in an assignment for a class in computer science A brewery had to deliver beer to *ve* stores and the task was to write a computer program for determining the shortest route for the truck driver to visit all stores and return to the brewery All my attempts to find a reasonable algorithm failed I could not help enumerating all possible routes and then select the best one

Advances In Combinatorial Optimization: Linear Programming Formulations Of The Traveling Salesman And Other Hard Combinatorial Optimization Problems Moustapha Diaby, Mark H Karwan, 2016-01-28 Combinatorial optimization CO is a topic in applied mathematics decision science and computer science that consists of finding the best solution from a non exhaustive search CO is related to

disciplines such as computational complexity theory and algorithm theory and has important applications in fields such as operations research management science artificial intelligence machine learning and software engineering Advances in Combinatorial Optimization presents a generalized framework for formulating hard combinatorial optimization problems COPs as polynomial sized linear programs Though developed based on the traveling salesman problem TSP the framework allows for the formulating of many of the well known NP Complete COPs directly without the need to reduce them to other COPs as linear programs and demonstrates the same for three other problems e g the vertex coloring problem VCP This work also represents a proof of the equality of the complexity classes P polynomial time and NP nondeterministic polynomial time and makes a contribution to the theory and application of extended formulations EFs On a whole Advances in Combinatorial Optimization offers new modeling and solution perspectives which will be useful to professionals graduate students and researchers who are either involved in routing scheduling and sequencing decision making in particular or in dealing with the theory of computing in general

Approximation Algorithms for Traveling Salesman Problems Based on Linear Programming Relaxations Hyung Chan An, 2012 The traveling salesman problem TSP is the problem of finding a shortest Hamiltonian circuit or path in a given weighted graph This problem has been studied in numerous variants and linear programming has played an important role in the design of approximation algorithms for these problems In this thesis we study two versions of the traveling salesman problem and present approximation algorithms for them based on the Held Karp relaxation We first investigate the s t path TSP Hoogeveen showed that the natural variant of Christofides algorithm is a $5/3$ approximation algorithm for this problem this asymptotically tight bound had remained the best approximation ratio known until now We surpass this 20 year old barrier

by presenting a deterministic 1.5 approximation algorithm for the $s-t$ path TSP for an arbitrary metric. The techniques devised in this context can also be applied to other optimization problems including the prize collecting $s-t$ path problem and the unit weight graphical metric $s-t$ path TSP. The integrality gaps of the LP relaxations for all three problems are studied. Then we consider the bottleneck asymmetric TSP where the objective is minimizing the bottleneck or maximum length edge cost rather than the total edge cost. We present the first nontrivial approximation algorithm for this problem by giving a novel algorithmic technique to shortcut Eulerian circuits while bounding the lengths of the shortcuts needed. Building on this framework and the result of Asadpour, Goemans, Madry, Oveis Gharan, and Saberi, we achieve an $O(\log n \log \log n)$ approximation algorithm. We also explore the possibility of improvement upon this result through a comparison to the symmetric counterpart of the problem.
