These base stations provide the cell with the network coverage which can be used for transmission of voice data and other types of content. A cell typically uses a different set of frequencies from neighbouring cells to avoid interference and provide guaranteed service quality within each cell.

Wireless and Mobile Communications Jack M. Holtzman, David J. Goodman, 2012-12-06

In October 1993 the Rutgers University Wireless Information Network Laboratory hosted the fourth WINLAB Workshop on Third Generation Wireless Information Networks. These events bring together a select group of experts interested in the long term future of Personal Communications, Mobile Computing and other services supported by wireless telecommunications technology. This is a fast moving field and we already see in present practice realizations of visions articulated in the earlier Workshops. In particular the second generation systems that absorbed the attention of the first WINLAB Workshop are now commercial products. It is an interesting reflection on the state of knowledge of wireless communications that the debates about the relative technical merits of these systems have not yet been resolved. Meanwhile in the light of United States Government announcements in September 1993 the business and technical communities must confront this year a new generation of Personal Communications Services. Here we have applications in search of the best technologies rather than the reverse. This is a rare situation in the information business. Today's advanced planning and forward looking studies will prevent technology shortages and uncertainties at the end of this decade. By then market size and public expectations will surpass the capabilities of the systems of the mid 1990's. Third Generation Wireless Information Networks will place greater burdens on technology than their predecessors by offering a wider range of services and a higher degree of service integration.

Mobile Communications Jochen H. Schiller, 2003

The mobile communications market remains the fastest growing segment of the global computing and communications business. The rapid progress and convergence of the field has created a need for new techniques and solutions knowledgeable professionals to create and implement them and courses to teach the background theory and technologies while pointing the way towards future trends. In this book Jochen Schiller draws on his extensive experience to provide a thorough grounding in mobile communications describing the state of the art in industry and research while giving a detailed technical background to the area. The book covers all the important aspects of mobile and wireless communications from the Internet to signals access protocols and cellular systems emphasizing the key area of digital data transfer. It uses a wide range of examples and other teaching aids making it suitable for self study and university classes. The book begins with an overview of mobile and wireless applications covering the history and market and providing the foundations of wireless transmission and Medium Access Control. Four different groups of wireless network technologies are then covered: telecommunications systems, satellite systems, broadcast systems and wireless LAN. The following chapters about the network and transport layers address the impairments and solutions using well known Internet protocols such as TCP/IP in a mobile and wireless environment. The book concludes with a chapter on technologies supporting applications in mobile networks.
