Ploidy and Hybridization for Crop Improvement Annaliese S. Mason,2017-11-22 Many of our current agricultural crops are natural or agricultural hybrids between two or more species or polyploids containing more than one genome or set of chromosomes These include potato oats cotton oilseed rape wheat strawberries kiwifruit banana seedless watermelon triticale and many others Polyploidy and hybridization can also be used for crop improvement for example to introgress disease resistance from wild species into crops to produce seedless fruits for human consumption or even to create entirely new crop types Some crop genera have hundreds of years of interspecific hybridization and ploidy manipulation behind them while in other genera use of these evolutionary processes for crop improvement is still at the theoretical stage This book brings together stories

and examples by expert researchers and breeders working in diverse crop genera and details how polyploidy and hybridization processes have shaped our current crops how these processes have been utilized for crop improvement in the past and how polyploidy and interspecific hybridization can be used for crop improvement in the future
