04 - MINDFULNESS-BASED COGNITIVE THERAPY (MBCT) IN THE TREATMENT OF MAJOR DEPRESSION. PRELIMINARY EVIDENCE FOR ITS EFFECTIVENESS AND MECHANISMS OF CHANGE, AN RCT STUDY. John B. Nezlek, 2017 Introduction Major Depressive Disorder MDD is a pervasive disorder estimated to be the leading cause of disability worldwide Although current treatments lead to improvement in majority of depressed individuals more needs to be known about new therapies modalities and their mechanisms of action Although mindfulness based cognitive therapy MBCT has been found to be effective in preventing the relapse of recurrent depression it is not clear if MBCT is effective for currently depressed individuals Objectives The aim of the current research was to evaluate if MBCT can reduce depressive symptoms and to assess mechanisms underlying such changes Methods 56 individuals with a diagnosis of MDD were randomly assigned to MBCT n 26 and Waiting List n 30 conditions Prior and post 8 weeks intervention they completed questionnaires maintained a diary for 7 days and unscrambled a list of scrambled sentences as a measure of their depressive interpretation bias Scramble Sentences Test SST with eye movements being recorded during task Results We found reduction in depressive symptoms together with increase in

mindfulness in MBCT group After MBCT participants perceived events as more positive and less stressful and they used significantly fewer negation and discrepancy words Moreover they made more positive interpretations in the SST than before training fixated less on negative keywords and more on positive keywords than at the pre test No such differences were found for the waiting group Conclusions These findings suggest that MBCT can be effective in treating current depression and indicate possible mechanisms underlying therapeutic change

Mindfulness-based Cognitive Therapy Intervention for the Treatment of Late-life Depression and Anxiety Symptoms in Primary Care Diana Sophia Escobar Moreno,2019 Depression and anxiety are disabling psychiatric conditions worldwide Approximately 10 20% of older adults treated in primary care settings suffer from late life depression LLD and or late life anxiety LLA Older adults are often undertreated and or do not receive the appropriate treatment for LLD and or LLA in primary care due to the lack of available resources and high demands on the health care system Evidence has shown that antidepressants are the first line of treatment for LLD and LLA in older adults in primary care settings Typically the geriatric population does not respond well to psychotropic medication due to comorbidities with other illnesses and polypharmacy leading to high readmission rates As the population ages the number of older adults treated in primary care increases therefore there is an urgent need to find effective scalable and potentially cost effective alternative therapies This study examined the potential benefit that Mindfulness Based Cognitive Therapy MBCT may have on the symptoms of LLD and or LLA in older adults compared to treatment as usual TAU A sample of 61 older adults age 67 8 6 2 years with symptoms of depression and or anxiety were randomized to MBCT or TAU in a primary care setting Primary outcomes measured a post pre change in depression symptoms PHQ 9 The secondary outcome examined a post pre changes in anxiety symptoms GAD7 anxiety scores Exploratory outcomes included a post pre changes in health related quality of life and quality of sleep The study also aimed to assess feasibility acceptability and tolerability of the MBCT intervention with the geriatric population Results from this study showed that participants in the MBCT group compared to TAU significantly improved in depressive and anxiety symptoms scores as well in the health related quality of life scores The MBCT intervention was feasible with an enrollment rate of 80 3% and an intervention completion rate of 78% The MBCT intervention was acceptable with a study retention rate of 87% Most of the participants found the MBCT intervention tolerable enjoying the mindfulness meditation intervention especially the guided meditations In conclusion the MBCT intervention may potentially benefit and give an alternative treatment for older adults in primary care suffering from depression and or anxiety symptoms Implementing these types of evidence based therapies could target more people at once and reduce the amount of staff required which may potentially lead to less costs overall To our knowledge this is the first well controlled RCT study in the field using MBCT for older adults with symptoms of depression and or anxiety in primary care Future studies are needed to replicate and to evaluate the

effects of MBCT while using an active control group The long term effects of MBCT must also be studied as well as studies implementing more formal systematic diagnostic when assessing depression and or anxiety in this population

Mindfulness-based Cognitive Therapy for Recurrent Depression and Anxiety Lauren Clare Wood, 2011 Mindfulness based Cognitive Therapy (MBCT) is a class based manualised program designed to treat recurrent depression and prevent relapse. MBCT has been found to be effective for both symptomatic and asymptomatic patients with three or more previous episodes of depression. While research estimates that 50-75% of individuals with depression also experience anxiety, the role of anxiety in the MBCT treatment of recurrent depression is not clearly understood. The aim of the present study was to fill this gap in the literature in order to understand the effect that MBCT has on anxiety outcomes and the effect that anxiety has on depression outcomes. Sixty seven individuals with recurrent depression completed an MBCT course and were followed for up to 49 months. MBCT was found to significantly reduce levels of anxiety both in the short and long term. Secondly, while MBCT was effective in reducing levels of depression and depressive relapse, it was more effective for individuals who were not clinically anxious at the beginning of treatment. The results support the use of MBCT in treating individuals with recurrent depression and co-occurring anxiety in order to reduce depressive and anxiety symptoms. Future research into ways that the MBCT protocol could be adapted to better accommodate individuals with anxiety may reduce the discrepancy between those with and without anxiety symptoms and greatly assist the large proportion of individuals who enroll in MBCT programs and who experience both recurrent depression and anxiety.
