The Complete Technology Book on Plastic Films, HDPE and Thermoset Plastics NIIR Board of Consultants & Engineers, 2006-01-01 Plastic Films HDPE and Thermoset Plastics are now an accepted part of the industrial and domestic scenes but this growth has been comparatively recent Plastic films are typically used for sealing food items in containers to keep them fresh over a longer period of time Plastic wrap typically sold on rolls in boxes with a cutting edge clings to many smooth surfaces and can thus remain tight over the opening of a container without adhesive or other devices The past several years have seen numerous plastic films developed for the packaging industry the most used today being polyethylene Cast polypropylene film like polyethylene film is unoriented not stretched but it was found that an improved film could be obtained by orientation stretching the cast in one or more directions Biaxial orientation is the process whereby the continuous cast film or sheet of plastic is heated up to brings it to a temperature that makes it stretchable BOPP film possesses superior tensile strength flexibility toughness shrink ability good barrier and optical characteristics The use of polyethylene terephthalate film is increasing considerably in recent years in videos audio magnetic tapes computer tapes photo and X ray films power capacitors insulation tapes and metalling for artificial zari High density polyethylene HDPE or polyethylene high density PEHD is a polyethylene thermoplastic made from petroleum The major applications of HDPE are in the manufacturing of containers pipes house wares toys filament woven sacks film wire and cable insulation HDPE is lighter than water and can be moulded machined and joined together using welding difficult to glue Thermoset or thermosetting plastics are synthetic materials that strengthen during being heated but cannot be successfully remolded or reheated after their initial heat forming This is in contrast to thermoplastics which soften when heated and harden and strengthen after cooling Thermoplastics can be heated shaped and cooled as often as necessary without causing a chemical change while thermosetting plastics will burn when heated after the initial molding Additionally thermoplastics tend to be easier to mold than thermosetting plastics which also take a longer time to produce due to the time it takes to cure the heated material Some of the astonishing fundamentals of the book are salient features of contemporary technology and current research three basic processes advances modern polyethylene processes using high yield catalysts solution polymerization processes polyolefins low density polyethylene polyvinylidene chloride PVDC vinyl chloride vinyl acetate copolymers polyvinyl acetate polyvinyl alcohol physical and chemical properties manufacturing methods extrusion of film slit die extrusion flat film

Extrusion, Moulding And Mould Designs NIIR Board of Consultants and Engineers,2006-10-01

Plastics extrusion is a high volume manufacturing process in which raw plastic material is melted and formed into a continuous profile Extrusion produces items such as pipe tubing weather stripping fence deck railing window frames adhesive tape and wire insulation There are fundamentally two different methods of extruding film namely below extrusion and slit die extrusion The design and operation of the extruder up to the die is the same for both methods The moulding process is one of the most important plastic processing operations It is an important commercial process whereby a resinous polymeric compound is converted into useful finished articles The origin of this process is dates back about a century to the invention of a plunger type machine The mould has its own importance which give the required shapes of the products The vast growth of injection moulding is reflected dramatically in many types and sizes of equipment available today Plastic moulding especially thermoplastic items may be produced by compression moulding methods but since they are soft at the temperature involved it is necessary to cool down the mould before they may be ejected Injection moulding differs from compression moulding is that the plastic material is rendered fluid in a separate chamber or barrel outside the mould is then forced into the mould cavity by external pressure Plastic technology is one of the most vigorous manufacturing branches characterised by new raw materials changing requirements and continuous development in processing methods The injection moulding machines manufacturers plays an important part in the creation of injection moulding technology process control to essential mechanical engineering Even though design is a specialized phase in engineering field in tool and mould engineering it is totally divided into two wings as product design and tool and die design This book basically deals with transport phenomena in polymer films reinforcements for thermosets miscellaneous thermoset processes injection molding blow molding extrusion basic principles of injection moulding correct injection speed is necessary for filling the mould plastic melt should not suffer degradation the mould must be controlled for better quality product logical consideration of moulding profile and material is important than standard setting guide lines economical setting of the machine proper maintenance of machine safety operations preliminary checking for moulding material component mould machine injection moulding technique the various type of injection moulding machines specifications platen mounting of moulds locating spigots mould clamping etc The book covers manufacturing processes of extruded and moulded products with the various mould designs This is very useful book for new entrepreneurs technocrats researchers libraries etc TAGS

The Complete Technology Book on Fibre Glass, Optical Glass and Reinforced Plastics NIIR Board of Consultants and Engineers, 2006-10-01 Although many natural materials were used in the past by man answering his instinctive urges to prevent heat loss from or entry into his dwellings no material in modern technology has satisfied the all around requirements as has fiber Glass Fiber glass optical glass and reinforced plastics have important applications and uses in the making of various products Fiberglass is a lightweight extremely strong and robust material Although strength properties are somewhat lower than carbon fiber and it is less stiff the material is typically far less brittle and the raw materials are much less expensive Its bulk strength and weight properties are also very favorable when compared to metals and it can be easily formed using molding processes Fibre glass behaves as a thermal insulation because of its entrapment of small cells of air and prevention of movement of the air in those cells In acoustical applications fibre glass presents to advancing sound waves a myriad of small anechoic chambers which reflect the sound inward from many diverse surfaces until it becomes blotted out Optical glass is a high glass material that has been seen specifically formulated to possess certain desirable characteristics that effect the propagation of light The two primary parameters that define the basic types of optical glass are its refractive index and its dispersion Transportation on wheel is of special significance to the reinforced plastics industry on a number of counts Suppliers of reinforced plastics parts are often called upon to furnish prototypes of products being considered for auto truck and bus applications Performance and
