Beckenbach, R. Bellman, 2012-12-06 Since the classic work on inequalities by HARDY LITTLEWOOD and Pólya in 1934 an enormous amount of effort has been devoted to the sharpening and extension of the classical inequalities to the discovery of new types of inequalities and to the application of inequalities in many parts of analysis As examples let us cite the fields of ordinary and partial differential equations which are dominated by inequalities and variational principles involving functions and their derivatives the many applications of linear inequalities to game theory and mathematical economics which have triggered a renewed interest in convexity and moment space theory and the growing uses of digital computers which have given impetus to a systematic study of estimates involving much sophisticated matrix theory and operator theory The results presented in the following pages reflect to some extent these ramifications of inequalities into contiguous regions of analysis but to a greater extent our concern is with inequalities in their native habitat Since it is clearly impossible to give a connected account of the burst of analytic activity of the last twenty five years centering about inequalities we have decided to limit our attention to those topics that have particularly delighted and intrigued us and to the study of which we have contributed **Mathematical Reviews**, 2005 *Lecture Notes in Pure and Applied Mathematics*, 1977 Classical and Quantum Physics G. Marmo, David Martín de Diego, Miguel Muñoz Lecanda, 2019-10-26 This proceedings is based on the interdisciplinary workshop held in Madrid 5-9 March 2018 dedicated to Alberto Ibort on his 60th birthday Alberto has great and significantly contributed to many fields of mathematics and physics always with highly original and innovative ideas Most of Alberto's scientific activity has been motivated by geometric ideas concepts and tools that are deeply related to the framework of classical dynamics and quantum mechanics Let us mention some of the fields of expertise of Alberto Ibort Geometric Mechanics Constrained Systems Variational Principles Multisymplectic structures for field theories Super manifolds Inverse problem for Bosonic and Fermionic systems Quantum Groups Integrable systems BRST Symmetries Implicit differential equations Yang Mills Theories BiHamiltonian Systems Topology Change and Quantum Boundary Conditions Classical and Quantum Control Orthogonal Polynomials Quantum Field Theory and Noncommutative Spaces Classical and Quantum Tomography Quantum Mechanics on phase space Wigner Weyl formalism Lie Jordan Algebras Classical and Quantum Quantum to Classical transition Contraction of Associative Algebras contact geometry among many

others In each contribution one may find not only technical novelties but also completely new way of looking at the considered problems Even an experienced reader reading Alberto s contributions on his field of expertise will find new perspectives on the considered topic His enthusiasm is happily contagious for this reason he has had and still has very bright students wishing to elaborate their PhD thesis under his guidance What is more impressive is the broad list of rather different topics on which he has contributed
