Reinforcement Learning An Introduction Richard S Sutton:

   Reinforcement Learning Richard S. Sutton,2012-12-06 Reinforcement learning is the learning of a mapping from situations to actions so as to maximize a scalar reward or reinforcement signal The learner is not told which action to take as in most forms of machine learning but instead must discover which actions yield the highest reward by trying them In the most interesting and challenging cases actions may affect not only the immediate reward but also the next situation and through that all subsequent rewards These two characteristics trial and error search and delayed reward are the most important distinguishing features of reinforcement learning Reinforcement learning is both a new and a very old topic in AI The term appears to have been coined by Minsk 1961 and independently in control theory by Walz and Fu 1965 The earliest machine learning research now viewed as directly relevant was Samuel s 1959 checker player which used temporal difference learning to manage delayed reward much as it is used today Of course learning and reinforcement have been studied in psychology for almost a century and that work has had a very strong impact on the AI engineering work One could in fact consider all of reinforcement learning to be simply the reverse engineering of certain psychological learning processes e g operant conditioning and secondary reinforcement Reinforcement Learning is an edited volume of original research comprising seven invited contributions by leading researchers   *Reinforcement Learning* Richard S. Sutton,Andrew G. Barto,1998 An account of key ideas and algorithms in reinforcement learning The discussion ranges from the history of the field s intellectual foundations to recent developments and applications Areas studied include reinforcement learning problems in terms of Markov decision problems and solution methods   **Exploiting Environment Configurability in Reinforcement Learning** Alberto Maria Metelli,2022-12-15 In recent decades Reinforcement Learning RL has emerged as an effective approach to address complex control tasks In a Markov Decision Process MDP the framework typically used the environment is assumed to be a fixed entity that cannot be altered externally There are however several real world scenarios in which the environment can be modified to a limited extent This book Exploiting Environment Configurability in Reinforcement Learning aims to formalize and study diverse aspects of environment configuration In a traditional MDP the agent perceives the state of the environment and performs actions As a consequence the environment transitions to a new state and generates a reward signal The goal of the agent consists of learning a policy i e a prescription of actions that maximize the long term reward Although environment configuration arises quite often in real applications the topic is very little explored in the literature The contributions in the book are theoretical algorithmic and experimental and can be broadly subdivided into three parts The first part introduces the novel formalism of Configurable Markov Decision Processes Conf MDPs to model the configuration opportunities offered by the environment The second part of the book focuses on the cooperative Conf MDP setting and investigates the problem of finding an agent policy and an environment configuration that jointly optimize the long term reward The third part addresses two specific applications of the Conf MDP framework policy

space identification and control frequency adaptation The book will be of interest to all those using RL as part of their work **Reinforcement Learning** Richard S. Sutton,2000 **Reinforcement Learning** Richard S. Sutton,1998
