*Downstream Processing of Proteins* Mohamed A. Desai, 2008-02-05 Considerable effort and time is allocated to introducing cell culture and fermentation technology to undergraduate students in academia generally through a range of courses in industrial biotechnology and related disciplines Similarly a large number of textbooks are available to describe the applications of these technologies in industry However there has been a general lack of appreciation of the significant developments in downstream processing and isolation technology the need for which is largely driven by the stringent regulatory requirements for purity and quality of injectable biopharmaceuticals This is particularly reflected by the general absence of coverage of this subject in many biotechnology and related courses in educational institutions For a considerable while I have felt that there is increasing need for an introductory text to various aspects of downstream processing particularly with respect to the needs of the biopharmaceutical and biotechnology industry Although there are numerous texts that cover various aspects of protein purification techniques in isolation there is a need for a work that covers the broad range of isolation technology in an industrial setting It is anticipated that *Downstream Processing of Proteins Methods and Protocols* will play a small part in filling this gap and thus prove a useful contribution to the field It is also designed to encourage educational strategists to broaden the coverage of these topics in industrial biotechnology courses by including accounts of this important and rapidly developing element of the industrial process

*Therapeutic Proteins* C. Mark Smales, David C. James, 2008-02-04 With the recent completion of the sequencing of the human genome it is widely anticipated that the number of potential new protein drugs and targets will escalate at an even greater rate than that observed in recent years However identification of a potential target is only part of the process in developing these new next generation protein based drugs that are increasingly being used to treat human disease Once a potential protein drug has been identified the next rate limiting step on the road to development is the production of sufficient authentic material for testing characterization clinical trials and so on If a protein drug does actually make it through this lengthy and costly process methodology that allows the production of the protein on a scale large enough to meet demand must be implemented Furthermore large scale production must not compromise the authenticity of the final product It is also necessary to have robust methods for the purification characterization viral inactivation and continued testing of the authenticity of the final protein product and to be able to formulate it in a manner that retains both its biological activity and lends itself to easy administration

*Therapeutic Proteins Methods and Protocols* covers all aspects of protein drug production downstream of the discovery stage This volume contains contributions from leaders in the field of therapeutic protein expression purification characterization formulation and viral inactivation
