Title: GitHub's Battle Against the Largest DDoS Attack

Introduction

GitHub, a platform where developers collaborate on projects, experienced an extraordinary event on Wednesday, February 28, 2018, at around 12:15 pm EST. A massive wave of traffic, 1.35 terabits per second, hit the website, marking the most powerful distributed denial of service (DDoS) attack ever recorded. Surprisingly, this attack did not require a botnet.

The Attack and Initial Response

A DDoS attack is like a digital traffic jam, where a website gets flooded with so much traffic that it can't handle it all, causing it to slow down or even stop working. In this case, GitHub faced a digital storm. For a few minutes, the website struggled with outages, but then it called for help from its DDoS mitigation service, Akamai Prolexic. Prolexic acted as a shield, routing all the traffic coming in and out of GitHub. It sent the data through special cleaning centers to separate and block the bad traffic from the good.

Comparing to Previous Attacks

The attack was significantly larger than a similar attack that happened in 2016 against an internet infrastructure company called Dyn. That attack reached 1.2 terabits per second and caused connectivity issues across the United States. However, this time, the good guys were prepared.

Defending Against the Attack

Akamai defended against the attack in several ways. In addition to Prolexic's general DDoS defense infrastructure, the company had also recently implemented specific defenses for a type of DDoS attack that comes from something called memcached servers. These servers are like digital librarians that help speed up networks and websites by remembering and quickly providing information. However, they're not supposed to be exposed on the public internet, where anyone can access them.

The Role of Memcached Servers

Unfortunately, about 100,000 memcached servers were exposed online without any protection. This meant that an attacker could access them and send them a special command, which the server would respond to with a much larger reply. This is like asking a librarian a simple question and getting a truckload of books in response!

Amplification Attacks

Unlike other DDoS attacks that use botnets (networks of infected computers) to flood websites with traffic, memcached DDoS attacks don't need a botnet. Instead, attackers just pretend to be their victim by using their victim's IP address and send small requests to multiple memcached

Common Sense Guide to Cyber Security for Small Businesses, 2005

Countdown to Zero Day Kim Zetter, 2014-11-11 Top cybersecurity journalist Kim Zetter tells the story behind the virus that sabotaged Iran's nuclear efforts and shows how its existence has ushered in a new age of warfare one in which a digital attack can have the same destructive capability as a megaton bomb In January 2010 inspectors with the International Atomic Energy Agency noticed that centrifuges at an Iranian uranium enrichment plant were failing at an unprecedented rate The cause was a complete mystery apparently as much to the technicians replacing the centrifuges as to the inspectors observing them Then five months later a seemingly unrelated event occurred A computer security firm in Belarus was called in to troubleshoot some computers in Iran that were crashing and rebooting repeatedly At first the firm's programmers believed the malicious code on the machines was a simple routine piece of malware But as they and other experts around the world investigated they discovered a mysterious virus of unparalleled complexity They had they soon learned stumbled upon the world's first digital weapon For Stuxnet as it came to be known was unlike any other virus or worm built before Rather than simply hijacking targeted computers or stealing information from them it escaped the digital realm to wreak actual physical destruction on a nuclear facility In these pages Wired journalist Kim Zetter draws on her extensive sources and expertise to tell the story behind Stuxnet's planning execution and discovery covering its genesis in the corridors of Bush's White House and its unleashing on systems in Iran and telling the spectacular unlikely tale of the security geeks who managed to unravel a sabotage campaign years in the making But Countdown to Zero Day ranges far beyond Stuxnet itself Here Zetter shows us how digital warfare developed in the US She takes us inside today's flourishing zero day grey markets in which intelligence agencies and militaries pay huge sums for the malicious code they need to carry out infiltrations and attacks She reveals just

how vulnerable many of our own critical systems are to Stuxnet like strikes from nation state adversaries and anonymous hackers alike and shows us just what might happen should our infrastructure be targeted by such an attack Propelled by Zetter s unique knowledge and access and filled with eye opening explanations of the technologies involved Countdown to Zero Day is a comprehensive and prescient portrait of a world at the edge of a new kind of war **CYBERSECURITY STRATEGIES AND BEST PRACTICES** MILAD.
