Program Monitoring and Visualization Clinton L. Jeffery, 2012-12-06 In computer science the primary application of visualization technology is software visualization the use of graphics to portray information obtained from a static or dynamic analysis of a program Software visualization is used in several phases of the software development lifecycle but it is of particular interest in the back end tasks of debugging performance tuning and understanding complex systems in order to maintain them Software visualization is expected to improve the back end of the software development process which can result in huge cost savings Debugging tuning and maintaining programs comprise the majority of the high costs associated with software development Unfortunately the rate at which these software technologies have improved has been gradual The task of writing software visualization tools is difficult and most existing systems are limited to a narrow scope such as the visualization of a single well understood algorithm from a hand instrumented source program This book presents software visualization at a level suitable for a senior level undergraduate or graduate course or for the interested technical professional The approach is to give a survey of the field and then present a specific research framework designed to reduce the effort required to write visualization tools A wide range of simple program control flow and data structure visualizations are then presented as examples of how to obtain information about program behavior and how to present it graphically

PRINCIPLES OF GRAPHIC DESIGN & TYPOGRAPHY. ,2025 **Designing Graphic Presentations from First Principles** Michael Schiff,1998 Abstract This dissertation outlines a first principles approach to automatically designing graphic presentations of information The components of this approach include a conceptual framework for discussing how presentations encode information algorithms for determining whether a method of presentation will be capable of presenting a given type of information and design principles for ensuring the interpretability and perceptual effectiveness of a method of presentation Compared with previous approaches to automatically designing presentations the approach outlined in this dissertation is more fine grained and more general It begins with an extremely general notion of how graphic presentations can encode information then develops this into a useful framework by making a number of explicit assumptions about the types of presentations that people can use This framework serves as a basis for analyzing the space of possible graphical languages i e the space of systematic methods of presenting data The logical adequacy of different graphical languages for different types of information and criteria and methods for composing graphical languages for different data are also explored In addition to this logical emphasis this dissertation also emphasizes the influence of psychological issues on the design of presentations It explores factors influencing the interpretability of presentations i e how easily viewers will grasp how information is encoded and outlines some general design principles for creating interpretable presentations It also explores perceptual issues in presentation including perceptual organization dimensional structure of visual stimuli and the effectiveness of perceptual operations and outlines design principles for guaranteeing the perceptual effectiveness of presentations The last emphasis of this dissertation is on operationalizing the framework and principles i e on using them to create graphical languages in a relatively efficient manner The implementation AUTOGRAPH demonstrates the flexibility and viability of a first principles approach
