These shapes are rendered in various shades of gray and red, creating a sense of depth and movement. The shapes are arranged in a way that suggests a 3D perspective, with some appearing to be in the foreground and others receding into the background. Glocalized Solutions for Sustainability in Manufacturing Jürgen Hesselbach, Christoph Herrmann, 2011-03-19 The 18th CIRP International Conference on Life Cycle Engineering LCE 2011 continues a long tradition of scientific meetings focusing on the exchange of industrial and academic knowledge and experiences in life cycle assessment product development sustainable manufacturing and end of life management The theme Glocalized Solutions for Sustainability in Manufacturing addresses the need for engineers to develop solutions which have the potential to address global challenges by providing products services and processes taking into account local capabilities and constraints to achieve an economically socially and environmentally sustainable society in a global perspective Glocalized Solutions for Sustainability in Manufacturing do not

only involve products or services that are changed for a local market by simple substitution or the omitting of functions. Products and services need to be addressed that ensure a high standard of living everywhere. Resources required for manufacturing and use of such products are limited and not evenly distributed in the world. Locally available resources, local capabilities as well as local constraints have to be drivers for product and process innovations with respect to the entire life cycle. The 18th CIRP International Conference on Life Cycle Engineering LCE 2011 serves as a platform for the discussion of the resulting challenges and the collaborative development of new scientific ideas.

Recent Advances in Achieving Textbook Multigrid Efficiency for Computational Fluid Dynamics Simulations Achi Brandt,2002 Recent advances in achieving textbook multigrid efficiency for fluid simulations are presented Textbook multigrid efficiency is defined as attaining the solution to the governing system of equations in a computational work which is a small multiple of the operation counts associated with discretizing the system Strategies are reviewed to attain this efficiency by exploiting the factorizability properties inherent to a range of fluid simulations including the compressible Navier Stokes equations factorizability is used to separate the elliptic and hyperbolic factors contributing to the target system each of the factors can then be treated individually and optimally Boundary regions and discontinuities are addressed with separate local treatments New formulations and recent calculations demonstrating the attainment of textbook efficiency for aerodynamic simulations are shown
