Quadrotor Modeling And Control:

Dynamic Modeling and Control of a Quadrotor Using Linear and Nonlinear Approaches Heba talla Mohamed Nabil Elkholy, American University in Cairo. School of Engineering Interdisciplinary Program, 2014 Abstract With the huge advancements in miniature sensors actuators and processors depending mainly on the Micro and Nano Electro Mechanical Systems MEMS NEMS many researches are now focusing on developing miniature flying vehicles to be used in both research and commercial applications This thesis work presents a detailed mathematical model for a Vertical Takeoff and Landing VTOL type Unmanned Aerial Vehicle UAV known as the quadrotor The nonlinear dynamic model of the quadrotor is formulated using the Newton Euler method the formulated model is detailed including aerodynamic effects and rotor dynamics that are omitted in many literature The motion of the quadrotor can be divided into two subsystems a rotational subsystem attitude and heading and a translational subsystem altitude and x and y motion Although the quadrotor is a 6 DOF underactuated system the derived rotational subsystem is fully actuated while the translational subsystem is underactuated The derivation of the mathematical model is followed by the development of four control approaches to control the altitude attitude heading and position of the quadrotor in space The first approach is based on the linear Proportional Derivative Integral PID controller The second control approach is based on the nonlinear Sliding Mode Controller SMC The third developed controller is a nonlinear Backstepping controller while the fourth is a Gain Scheduling based PID controller The parameters and gains of the forementioned controllers were tuned using Genetic Algorithm GA technique to improve the systems dynamic response Simulation based experiments were conducted to evaluate and compare the performance of the four developed control techniques in terms of dynamic performance stability and the effect of possible disturbances

Modeling and Control Simulation for Autonomous Quadrotor Idris Eko Putro, 2011-03 The use of Quadrotor UAVs has been widely well known It has capability to hover vertical take off and landing VTOL with having less complexity in vehicle dynamics compared with small helicopter It is basically an unstable system and exhibits nonlinear behavior This book describes the development of nonlinear model of quadrotor dynamics derived from Newton Euler formulation and presented under Matlab Simulink environment The Model is equipped by Stability Augmentation System SAS to maintain the quadrotor level flight attitude stability The autonomous mission for this vehicle is fixed for trajectory following LQR Optimal control was chosen to accomplish this mission

Modeling and Control of a Quadrotor in a Wind Field Nguyen Khoi Tran, 2016 In recent years there has been a surge of interest in the use of small unmanned air vehicles UAVs for various civilian and military applications Many of the proposed applications are outdoor and may include environments with high wind The relatively small size of quadrotors means that wind gusts can destabilize the quadrotor if the on board flight controller is not equipped to deal with wind effects This work investigates the ability of a quadrotor to maneuver in a wind field and develops a method to cope with wind disturbances A dynamic model of a quadrotor is presented to model its motion The quadrotor

model includes a wind effect model to quantify the effect of wind on the dynamics of a quadrotor A proportional integral derivative PID controller is shown as a baseline controller typically used on quadrotors A LQR controller is then shown as an alternative to a PID controller These two controllers are compared in a simulation environment using the wind effect model and simulated wind disturbances Both controllers are found to have similar performance in a wind field though the LQR controller is found to be easier to tune These experiments were then repeated using the AscTec Pelican quadrotor platform in an indoor environment A feedforward controller was developed which uses the wind effect model and a custom onboard wind sensor to generate control inputs that oppose the disturbance forces and moments In simulation the feedforward controller was effective in improving control performance while experimentally the feedforward control was not effective due to wind sensing errors

Robot Motion and Control 2007 Krzysztof R. Kozłowski, 2007-06-01 Robot Motion Control 2007 presents very recent results in robot motion and control Forty one short papers have been chosen from those presented at the sixth International Workshop on Robot Motion and Control held in Poland in June 2007 The authors of these papers have been carefully selected and represent leading institutions in this field Applied Computer Sciences in Engineering Juan Carlos Figueroa-García, Eduyn Ramiro López-Santana, José Luis Villa-Ramírez, Roberto Ferro-Escobar, 2017-09-13 This book constitutes the refereed proceedings of the Forth Workshop on Engineering Applications WEA 2017 held in Cartagena Colombia in September 2017 The 59 revised full papers presented were carefully reviewed and selected from 156 submissions The papers are organized in topical sections such as computer science computational intelligence simulation systems internet of things fuzzy sets and systems power systems logistics and operations management miscellaneous applications

Artificial Neural Networks for Engineering Applications Alma Y Alanis, Nancy Arana-Daniel, Carlos Lopez-Franco, 2019-02-13 Artificial Neural Networks for Engineering Applications presents current trends for the solution of complex engineering problems that cannot be solved through conventional methods The proposed methodologies can be applied to modeling pattern recognition classification forecasting estimation and more Readers will find different methodologies to solve various problems including complex nonlinear systems cellular computational networks waste water treatment attack detection on cyber physical systems control of UAVs biomechanical and biomedical systems time series forecasting biofuels and more Besides the real time implementations the book contains all the theory required to use the proposed methodologies for different applications

Modeling and Control of a Quadrotor with Dynamic Inertia Jared D. A. Becker, 2013 As the support and technology for unmanned vehicles has increased so have the possible applications for Unmanned Aerial Vehicles UAVs From military intelligence gathering missions to civilian search and rescue missions the demand for highly capable UAVs is high Drawing inspiration from biological examples such as the hawkmoth this research investigates the use of dynamic inertia as a control mechanism for small quadrotor helicopters Using Lagrangian mechanics a nonlinear 3D model and a nonlinear 2D model are developed for a quadrotor with dynamic inertia modeled as an actuated

pendulum mounted beneath the vehicle Designing a linear quadratic controller for a linearization of the system about the hovering flight condition and applying this controller to the nonlinear model results in a stabilizing dynamic inertia controller capable of adequate trajectory tracking for a simple desired trajectory Additional simulations also show that the linear controller has favorable robustness properties to compensate for modeling errors and nonlinearities
