Science Abstracts ,1995 **Charge-Sharing SAR ADCs for Low-Voltage Low-Power Applications** Taimur Rabuske, Jorge Fernandes, 2016-08-02 This book introduces readers to the potential of charge sharing CS successive approximation register SAR analog to digital converters ADCs while providing extensive analysis of the factors that limit the performance of the CS topology The authors present guidelines and useful techniques for mitigating the limitations of the architecture while focusing on the implementation under restricted power budgets and voltage supplies

Adiabatic Charging in SAR ADCs Aleksandr Gusev, 2024 Successive Approximation Register SAR is an established and well rounded Analog to Digital Converter ADC architecture allowing for medium resolution and medium conversion speed while being energy efficient and relatively small in area Switched capacitor Digital to Analog Converter DAC being an essential component of the SAR architecture in certain design configurations might contribute significantly to the overall ADC power consumption Adiabatic capacitor charging is a method that allows for increasing the charging efficiency using linear voltage or constant current to charge a capacitor A variation of this approach uses a series of small voltage steps instead of a voltage ramp which is particularly suitable for switched capacitor circuits as it does not require analog circuitry such as a voltage ramp generator or a current source This work investigates the stepwise capacitor charging approach applied to DAC in SAR ADC in terms of the architectural modifications and their influence on the resulting efficiency improvement The study begins with an estimation of the stepwise charging applied to a conventional DAC switching scheme The average energy consumption is derived as a function of the number of charging steps and resolution the results are verified in MATLAB For the

implementation of the approach other switching schemes were considered the selected monotonic switching scheme was then also modelled in MATLAB to evaluate the efficiency improvement depending on the number of charging steps in that case Stepwise charging requires several intermediate voltage levels in addition to the regular reference voltage The work includes the discussion and implementation of the onboard DC DC converter and the MATLAB model includes its influence on energy savings allowing for a design optimization as well as the selection of the converter s configuration in regards to the number of charging steps resolution and DAC unit capacitor size Finally the work describes a fabricated IC with two proof of concept ADC prototypes featuring 4 step charging applied to a 10 bit monotonic SAR ADC The circuits differ in terms of the DAC capacitance and conversion speed The first prototype has a sampling rate of 165 kS s and achieves SNDR of 57.63 dB The second prototype has a sampling rate of 1 MS s and achieves SNDR of 56.52 dB The architecture is designed with separated circuits for the SAR register and adiabatic charging control logic in order to better differentiate the control logic penalty related to stepwise charging To further identify the power savings in both prototypes the 1 step versions of each prototype with adiabatic circuitry removed from the layout are simulated in CAD and compared to the 4 step counterparts The evaluation of the first prototype shows a 26% reduction of the DAC power consumption including all the extra circuitry whereas the second prototype establishes the limitation of the approach where the energy savings were overpowered by the control logic penalty and DC DC converter switching losses The work discusses this limitation in detail describing the applicability area of adiabatic charging The proposed method allows the inclusion of these types of losses to optimize the configuration and estimate the benefits of the adiabatic switching in each case

Strategies for Reduced-code Static Testing of SAR ADCs Renato Silveira Feitoza, 2021 Characterizing the static linearity performance is one of the key tasks in the test of an Analog to Digital converter ADC Normally the static linearity performance figures are measured during the production phase and the standard methodologies in the industry require the collection of a large amount of data since each code needs to be measured a few times to average the effect of noise Reduced code techniques for ADC static linearity test have the potential to drastically reduce the number of necessary measurements for a complete static linearity characterization These techniques take advantage of the repetitive operation of certain families of converters such as pipeline successive approximation registers SARs cyclic etc In this thesis novel reduced code techniques for static linearity test of SAR ADCs are presented They are based on the on chip generation and measurement of the transitions of the internal digital to analog converter DAC of the ADC This allows inferring the complete transfer function of the ADC by measuring only a carefully selected subset of the total set of codes greatly reducing the global test time Moreover the inherent simplification of static linearity tests provided by reduced code techniques may open the door to a full built in self test BIST implementation This way tester requirements can be relaxed and test cost may be further contained by moving static linearity test resources to the device under test itself The proposed test methodology does not require a test stimulus and it is shown that the

necessary measurements can be easily extracted by reconfiguring portions of the SAR into a low resolution incremental converter

An 11-bit 20MS/s SAR ADC Using a Low-complexity Code-dependent Reference Ripple Suppression Technique [1],2019

Modeling of Channel Mismatch in Time-interleaved SAR ADC***Project Supported by the National Natural Science Foundation of China (Nos. 61234002, 61322405, 61306044, 61376033) and the National High-Tech Program of China (No. 2013AA014103).** ,2015

Abstract In a time interleaved analog to digital converter TI ADC several individual ADCs operate in parallel to achieve a higher sampling rate Low power consumption as well as good linearity can be obtained by applying successive approximation register SAR converters as sub channel ADCs In spite of the advantages this structure suffers from three mismatches which are offset mismatch gain mismatch and time skew This paper focuses on a TI SAR ADC with a number of channels The mismatch effects in the frequency domain are analyzed and the derived close form formulas are verified based on Matlab In addition we clarify that the standard deviation of DNL and INL of an M channel TI ADC is reduced by a factor of M compared to a single channel ADC The formulas can be used to derive the corresponding requirements when designing a TI ADC Our analysis process is able to inform the study of calibration algorithms
