

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the sliding, the rotation of the shafts in a bearing or other mechanical. These consist of 2 gaskets which distribute axial forces in a gasket with an application on all shafts and shaft components used to secure the shaft. A gasket is used to maintain the pressure in a shaft or a bearing throughout the life cycle application. The gasket compresses the shaft components between the mating surfaces of the shaft. This is done by creating a radial force on the shaft. The gasket is used to seal the shaft between the mating surfaces. If the gasket is not installed correctly for axial and rotational through the life of the application then it will be replaced by a gasket.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a shaft seal. Every gasket application or design has its own requirements therefore that must be addressed by gasket the manufacturer or select the gasket to use in your application.
