constrained Fletcher Powell algorithm The procedure finds the optimum storage capacity optimum dimensions and optimum location for an elevated inlet type tank shaped as an inverted truncated cone though the model can be modified to suit any definable shape of a tank The model also considers seepage and evaporation losses along with detailed construction costs which account for lead and lift in the excavation work The optimum location of the tank in the catchment is found by placing the tank in a position to maximize runoff considering irrigable area command area Whether or not one tank or several smaller tanks should be constructed is determined by comparing the unconstrained optimum size with the constrained optimum size for the catchment and choosing the minimum of the two The study concludes with a sensitivity analysis to determine the relationship between net benefits vs seepage rates and net benefits vs discount rates Most of the input data concerning soils and crop responses were from studies conducted at the International Crops Research Institute for Semi Arid tropics ICRISAT Hyderabad India
