A Primer on Semiconvex Functions in General Potential Theories Kevin R. Payne, Davide Francesco Redaelli, 2025-09-07 This book examines the symbiotic interplay between fully nonlinear elliptic partial differential equations and general potential theories of second order Starting with a self contained presentation of the classical theory of first and second order differentiability properties of convex functions it collects a wealth of results on how to treat second order differentiability in a pointwise manner for merely semicontinuous functions The exposition features an analysis of upper contact jets for semiconvex functions a proof of the equivalence of two crucial independently developed lemmas of Jensen on the viscosity theory of PDEs and Slodkowski on pluripotential theory and a detailed description of the semiconvex approximation of upper semicontinuous functions The foundations of general potential theories are covered with a review of monotonicity and duality and the basic tools in the viscosity theory of generalized subharmonics culminating in an account of the monotonicity duality method for proving comparison principles The final section shows that the notion of

semiconvexity extends naturally to manifolds A complete treatment of important background results such as Alexandrov's theorem and a Lipschitz version of Sard's lemma is provided in two appendices The book is aimed at a wide audience including professional mathematicians working in fully nonlinear PDEs as well as master's and doctoral students with an interest in mathematical analysis

Spectral Problems Associated with Corner Singularities of Solutions to Elliptic Equations Vladimir Kozlov, V. G. Maz'ya, Jürgen Rossmann, 2001 This book focuses on the analysis of eigenvalues and eigenfunctions that describe singularities of solutions to elliptic boundary value problems in domains with corners and edges The authors treat both classical problems of mathematical physics and general elliptic boundary value problems The volume is divided into two parts The first is devoted to the power logarithmic singularities of solutions to classical boundary value problems of mathematical physics The second deals with similar singularities for higher order elliptic equations and systems Chapter 1 collects basic facts concerning operator pencils acting in a pair of Hilbert spaces Related properties of ordinary differential equations with constant operator coefficients are discussed and connections with the theory of general elliptic boundary value problems in domains with conic vertices are outlined New results are presented Chapter 2 treats the Laplace operator as a starting point and a model for the subsequent study of angular and conic singularities of solutions Chapter 3 considers the Dirichlet boundary condition beginning with the plane case and turning to the space problems Chapter 4 investigates some mixed boundary conditions The Stokes system is discussed in Chapters 5 and 6 and Chapter 7 concludes with the Dirichlet problem for the polyharmonic operator Chapter 8 studies the Dirichlet problem for general elliptic differential equations of order $2m$ in an angle In Chapter 9 an asymptotic formula for the distribution of eigenvalues of operator pencils corresponding to general elliptic boundary value problems in an angle is obtained Chapters 10 and 11 discuss the Dirichlet problem for elliptic systems of differential equations of order 2 in an n dimensional cone Chapter 12 studies the Neumann problem for general elliptic systems in particular with eigenvalues of the corresponding operator pencil in the strip $m \leq \text{Re } \lambda \leq 2n - m$ It is shown that only integer numbers contained in this strip are eigenvalues Applications are placed within chapter introductions and as special sections at the end of chapters Prerequisites include standard PDE and functional analysis courses
