Yanxin Wang, 2011 The usefulness of the predictive simulations obtained with groundwater models is often hampered by the inability to indicate and preferably quantify the reliability of the model results Uncertainty in model predictions stems primarily from a number of errors relating to the model formulation such as inadequate concept of processes and interactions inadequate description of processes and interactions inadequate sense of spatial and temporal variability inadequate description of the state of the system incorrect coefficient values and improper specification of the error bounds In recent years much research has been carried out resulting in a variety of approaches that can be followed to incorporate the information about these errors into modelling process Various techniques have been developed to assess the confidence levels of model predictions so that users can account for uncertainties in the decision making process This publication contains 52 papers the ModelCARE 90 conference held in The Hague September 1990 **ModelCARE99**, 2000
