# Properties of Matter

**QUESTIONS**

Are you able to distinguish, based on the questions in school

- Why are solids, liquids and gases grouped together?
- Why are substances and mixtures classified together?

**What are Physical Properties?**

Look at the table in the chapter below to find out as many physical properties of four common substances.

If physical properties of substances are observed without changing the identity of the substance, these are physical properties of an object or matter. For example, you can identify an object's colour, shape, size, or weight. In general, the properties of an object are determined by the properties of the materials the object is made of.

Many of the physical properties of materials that make up objects can be measured. These properties include weight, hardness, magnetism, and the ability to conduct heat and electricity.

Some physical properties depend on how much of a material you have. In other words, a large amount of a material may have different properties from smaller amounts of the material. Other physical properties do not depend on how much of the material you have. They show that no matter how large or small a sample of material is, the particular property is always the same.
