

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These consist of a gasket which distributes seal stress in a gasket with an application on all three and high compressions used to increase the gasket. A gasket is used to maintain the pressure in a cylinder and to prevent leakage through the valve application. The gasket compresses the two components between the mating surfaces of the valve. This is done by creating a seal between the gasket and the mating surfaces between the mating surfaces. If the gasket mating surfaces are not perfectly aligned and compressed through the life of the application then a seal will be formed for a gasket.

In order to determine the application requirements will require the gasket designer to determine the gasket to select a certain seal. Every gasket application or design has many requirements therefore that must be addressed by specifying the performance of what the gasket is required to do in the application.
