High-precision Cone-beam CT Guidance of Head and Neck Surgery Nathaniel M. Hamming,2009 Modern image guided surgery aids minimally invasive high precision procedures that increase efficacy of treatment This thesis investigates two research aims to improve precision and integration of intraoperative cone beam CT CBCT imaging in guidance of head and neck H N surgery First marker configurations were examined to identify arrangements that minimize target registration error TRE Best arrangements minimized the distance between the configuration centroid and surgical

target while maximizing marker separation Configurations of few markers could minimized TRE with more markers providing improved uniformity Second an algorithm for automatic registration of image and world reference frames was pursued to streamline integration of CBCT with real time tracking and provide automatic updates per scan Markers visible to the tracking and imaging systems are automatically co localized and registered with equivalent accuracy and superior reproducibility compared to conventional registration Such work helps the implementation of CBCT in H N surgery to maximize surgical precision and exploit intraoperative image guidance

*Head and Neck Imaging Variants* Achilles Karagianis,2016-03-22 More than 4 800 illustrations address common head and neck imaging issues most often faced by radiologists in clinical practice Head and Neck Imaging Variants delivers more than 375 cases and 4 800 illustrations to help you determine whether a finding is truly abnormal or merely a variant and to avoid common imaging pitfalls Imaging variants affecting all areas of head and neck imaging are addressed Companion cases are included with almost all of the primary variant cases to help illustrate key differentiating imaging features In addition because interpreting the postoperative and irradiated neck can be a daunting task a large number of these cases are included in this textbook Since it is vital to understand the important characteristics of a variant or disease process in order to interpret imaging accurately short discussions about the variant and relevant pathology are included Salient features of the more common head and neck surgical procedures pertinent to image interpretation are also discussed FEATURES Valuable to the radiologist who interprets head and neck imaging as well as to residents and fellows Peer reviewed literature provided and referenced for the variants as well as for the companion cases Large high resolution images that clearly annotate the imaging findings

**Otolaryngology--head and Neck Surgery** ,2007 *Cone Beam Computed Tomography*

David Sarment, 2013-10-18 Written for the clinician Cone Beam Computed Tomography helps the reader understand how CBCT machines operate perform advanced diagnosis using CT data have a working knowledge of CBCT related treatment planning for specific clinical tasks and integrate these new technologies in daily practice This comprehensive text lays the foundation of CBCT technologies explains how to interpret the data recognize main pathologies and utilize CBCT for diagnosis treatment planning and execution Dr Sarment first addresses technology and principles radiobiologic risks and CBCT for head and neck anatomy The bulk of the text discusses diagnosis of pathologies and uses of CBCT technology in maxillofacial surgical planning orthodontic and orthognathic planning implant surgical site preparation CAD CAM surgical guidance surgical navigation endodontics airway measurements and periodontal disease *Design of a Dual Modality PET/Cone Beam CT Scanner* Predrag Sukovic, 2003 [Optimization of Cone Beam CT Imaging in the Head & Neck and Pelvic Regions](#) Michaela Lang, 2020 The use of an imaging modality such as cone beam computed tomography CBCT for verification and target location immediately prior to a radiotherapy fraction is essential in modern radiotherapy Image guided radiotherapy IGRT enables assessment and control of uncertainties in patient positioning reveals internal organ motion and deformation and paves the way towards adaptive radiotherapy ART However using CBCT images as an imaging modality leads to an additional radiation dose burden for patients The aim of this master thesis was to optimize CBCT acquisition and reconstruction protocols with regard to image quality and dose for treatments in the head and neck and pelvic regions and to analyze the trend of specific imaging parameters A second goal was to check long term stability of the radiation output of a selected imaging protocol If the image quality is optimized the visualization of anatomical details and the accuracy of the image guidance can be improved Nevertheless it is very challenging to find a compromise between better image quality and lower dose for the patients An improvement in image quality usually results in higher exposure and much longer acquisition and reconstruction time of the image data which is not beneficial for the patients By using an F1 filter in the head and neck regions the dose burden for patients can be reduced by approximately 40 % average value of two LINACs The image quality is also slightly improved by the exchanged filter as a slightly higher SNR could be determined which is desirable Therefore an implementation of an imaging protocol with this filter into clinical routine should be considered In the pelvic regions a dose reduction can be achieved by increasing the gantry speed when taking CBCT images Although the results showed a slightly lower image quality the faster rotation of the gantry provides better patient comfort as the time on the treatment table can be reduced by almost one minute Patient *Schwartz's Principles of Surgery, 10th edition* F.
