Scheduling in Distributed Computing Systems Deo Prakash Vidyarthi,Biplab Kumer Sarker,Anil Kumar Tripathi,Laurence Tianruo Yang,2008-10-20 Scheduling in Distributed Computing Systems Analysis Design and Models intends to inculcate the innovative ideas for the scheduling aspect Although the models in this book are designed for distributed systems the same information is applicable for any type of system i e where distributed processing is required Scheduling in Distributed Computing Systems Analysis Design and Models will dramatically improve the design and management of the processes for industry professionals This book deals exclusively with the scheduling aspect which finds little space in other distributed operating system books Scheduling in Distributed Computing Systems Analysis Design and Models is structured for a professional audience composed of researchers and practitioners in industry This book is also suitable as a reference for graduate level students in management sciences and computer science for distributed computing system classes **A**

Theory of Distributed Objects Denis Caromel,Ludovic Henrio,2005-07-14 Distributed and communicating objects are becoming ubiquitous In global Grid and Peer to Peer computing environments extensive use is made of objects interacting through method calls So far no general formalism has been proposed for the foundation of such systems Caromel and Henrio are the first to define a calculus for distributed objects interacting using asynchronous method calls with generalized futures i e wait by necessity a must in large scale systems providing both high structuring and low coupling and thus scalability The authors provide very generic results on expressiveness and determinism and the potential of their approach is further demonstrated by its capacity to cope with advanced issues such as mobility groups and components Researchers and graduate students will find here an extensive review of concurrent languages and calculi with comprehensive figures and summaries Developers of distributed systems can adopt the many implementation strategies that are presented and analyzed in detail Preface by Luca Cardelli

Architectural Transformations in Network Services and Distributed Systems Andriy Luntovskyy,Josef Spillner,2017-03-23 With the given work we decided to help not only the readers but ourselves as the professionals who actively involved in the networking branch with understanding the trends that have developed in recent two decades in distributed systems and networks Important architecture transformations of distributed systems have been examined The examples of new architectural solutions are discussed **RESTful Rails Development** Silvia

Puglisi,2015-10-08 The Web is slowly but surely changing from a model in which a human reader browses content on web pages to a model in which services and clients not necessarily humans exchange information And because of this author Silvia Puglisi explains it makes more sense to build platforms instead of just products or applications Platforms are like

ecosystems interconnecting different applications services users developers and partners and offer many benefits In this book you ll learn how to design and develop Representational State Transfer REST platforms in Rails You ll begin with an introduction to Ruby on Rails and then move quickly through new concepts At the end of each chapter you ll have learned something new about building and organically extending a multi service platform spanning different devices and will have had some fun in the process By the end of the book you ll know how to build an architecture composed of different services accessing shared resources through a set of collaborating APIs and applications Explore the basics of REST and HTTP including REST architecture and the role of hypermedia Get to know Rails and Ruby on Rails Learn about API development and create an API Take a thorough look at REST including Asynchronous REST and testing RESTful services Work with data streams as you map them onto an application UI and integrate external APIs in your application Learn about device independent development Use data analytics to recognize important events develop key metrics and track them Explore various tools you can use to build your own data analytic platform Learn how to scale a Rails application successfully Examine privacy and security issues and the implications of handling and collecting user data

Parameterized Verification of Synchronized Concurrent Programs Zeinab Ganjei,2021-03-19 There is currently an increasing demand for concurrent programs Checking the correctness of concurrent programs is a complex task due to the interleavings of processes Sometimes violation of the correctness properties in such systems causes human or resource losses therefore it is crucial to check the correctness of such systems Two main approaches to software analysis are testing and formal verification Testing can help discover many bugs at a low cost However it cannot prove the correctness of a program Formal verification on the other hand is the approach for proving program correctness Model checking is a formal verification technique that is suitable for concurrent programs It aims to automatically establish the correctness expressed in terms of temporal properties of a program through an exhaustive search of the behavior of the system Model checking was initially introduced for the purpose of verifying finite state concurrent programs and extending it to infinite state systems is an active research area In this thesis we focus on the formal verification of parameterized systems That is systems in which the number of executing processes is not bounded a priori We provide fully automatic and parameterized model checking techniques for establishing the correctness of safety properties for certain classes of concurrent programs We provide an open source prototype for every technique and present our experimental results on several benchmarks First we address the problem of automatically checking safety properties for bounded as well as parameterized phaser programs Phaser programs are concurrent programs that make use of the complex synchronization construct of Habanero Java phasers For the bounded case we establish the decidability of checking the violation of program assertions and the undecidability of checking deadlock freedom For the parameterized case we study different formulations of the verification problem and propose an exact procedure that is guaranteed to terminate for some reachability problems even in the presence of unbounded phases and arbitrarily many

spawned processes Second we propose an approach for automatic verification of parameterized concurrent programs in which shared variables are manipulated by atomic transitions to count and synchronize the spawned processes For this purpose we introduce counting predicates that related counters that refer to the number of processes satisfying some given properties to the variables that are directly manipulated by the concurrent processes We then combine existing works on the counter predicate and constrained monotonic abstraction and build a nested counterexample based refinement scheme to establish correctness Third we introduce Lazy Constrained Monotonic Abstraction for more efficient exploration of well structured abstractions of infinite state non monotonic systems We propose several heuristics and assess the efficiency of the proposed technique by extensive experiments using our open source prototype Lastly we propose a sound but in general incomplete procedure for automatic verification of safety properties for a class of fault tolerant distributed protocols described in the Heard Of HO for short model The HO model is a popular model for describing distributed protocols We propose a verification procedure that is guaranteed to terminate even for unbounded number of the processes that execute the distributed protocol
