Scientific Programming and

Computer Architecture Divakar Viswanath, 2017-07-28 A variety of programming models relevant to scientists explained with an emphasis on how programming constructs map to parts of the computer. What makes computer programs fast or slow? To answer this question we have to get behind the abstractions of programming languages and look at how a computer really works. This book examines and explains a variety of scientific programming models relevant to scientists with an emphasis on how programming constructs map to different parts of the computer's architecture. Two themes emerge: program speed and program modularity. Throughout this book, the premise is to get under the hood, and the discussion is tied to specific programs. The book digs into linkers, compilers, operating systems, and computer architecture to understand how the different parts of the computer interact with programs. It begins with a review of C/C++ and explanations of how libraries, linkers, and Makefiles work. Programming models covered include Pthreads, OpenMP, MPI, TCP/IP, and CUDA. The emphasis on how computers work leads the reader into computer architecture and occasionally into the operating system kernel. The operating system studied is Linux, the preferred platform for scientific computing. Linux is also open source, which allows users to peer into its inner workings. A brief appendix provides a useful table of machines used to time programs. The book's website https://github.com/divakarvi/bk_spc has all the programs described in the book as well as a link to the HTML text.

IP over WDM Kevin H. Liu, 2002-11-01 This is the first book to focus on IP over WDM optical networks. It not only summarizes the fundamental mechanisms and the recent development and deployment of WDM optical networks but it also details both the network and the software architectures needed to implement WDM-enabled optical networks designed to transport IP traffic. The next generation network employing IP over optical networks is quickly emerging not only in the backbone but also in metro and access networks. Fiber optics revolutionizes the telecom and networking industry by offering enormous network capacity to sustain the next generation Internet growth. IP provides the only convergence layer in a global and ubiquitous Internet. So integrating IP and WDM to transport IP traffic over WDM-enabled optical networks efficiently and effectively is an urgent yet important task. Covers hot areas like traffic engineering, MPLS, peer-to-peer computing, IPv6. Comprehensive overview of history, background, and research. Presents all requirements for a WDM optical network enabling technologies, optical components, software architecture, management, etc. Performance studies and descriptions of experimental WDM optical networks guarantee the practical approach of the book. Technical engineers and network practitioners, designers, and analysts, network managers, and technical management personnel, as well as first-year graduate students or senior undergraduate students majoring in networking and/or network control and management will all find this indispensable.

Security in Computing Systems Joachim Biskup, 2008-11-14 This monograph on Security in Computing Systems: Challenges, Approaches, and Solutions aims at introducing surveying and assessing the fundamentals of security with respect to computing. Here, computing refers to all activities which individuals or groups directly or indirectly perform by means of computing systems, i.e., by means of computers and networks of them built on telecommunication. We all are such

individuals whether enthusiastic or just bowed to the inevitable So as part of the information society we are challenged to maintain our values to pursue our goals and to enforce our interests by consciously designing a global information infrastructure on a large scale as well as by appropriately configuring our personal computers on a small scale As a result we hope to achieve secure computing Roughly speaking computer assisted activities of individuals and computer mediated cooperation between individuals should happen as required by each party involved and nothing else which might be harmful to any party should occur The notion of security circumscribes many aspects ranging from human qualities to technical enforcement First of all in considering the explicit security requirements of users administrators and other persons concerned we hope that usually all persons will follow the stated rules but we also have to face the possibility that some persons might deviate from the wanted behavior whether accidentally or maliciously
