

ENERGY STATION

Inside the energy station, heat is transferred to or from closed ground loops using heat pumps or heat exchangers.

Geothermal district-scale systems can provide heating and cooling to residential, commercial, and community buildings.

Warm Water

Cool Water

Closed-loop geothermal systems circulate a fluid through tubing buried in the ground or under water.

In the winter, the energy station pumps hot water through pipes to heat buildings on the district system, and the cooled water returns to the energy station for reheating. **In the summer,** the energy station pumps cold water through pipes to cool buildings on the district system, and the warmed water returns to the energy station for recooling.

The pipes are about the depth of an average natural gas system.

Geothermal District Heating & Cooling 101

This illustration is one configuration of a geothermal district heating and cooling (GDHC) system, in this case using geothermal heat pumps. There are many other GDHC solutions that might also work for your community.
