Designing Flyback Converters Using Peak-Current-Mode Controllers

By: Giovanni De Vito
May 01, 2013

Abstract: Flyback converters design using peak-current-mode (PCM) is addressed. Design methodology and calculations for continuous-conduction mode (CCM) and discontinuous-conduction mode (DCM) and hybrid converters.

Introduction

This application note describes the methodology of designing flyback converters using the [TI.com PowerMANAGER](#) peak-current-mode controller. Flyback converters may be operated in discontinuous-conduction mode (DCM) or continuous-conduction mode (CCM). The important design issues are: dc-link filter, dual active bridge design (by separating in the operating mode of the converter), formulas for calculating component values and ratings are also presented.

DCM Flyback

Primary Inductance Selection

In a DCM flyback converter, the energy stored in the primary inductance of the flyback transformer is delivered during the output. The important primary inductance value for which the converter behaves in DCM at all operating conditions can be calculated as:

$$L_{\text{primary}} = \frac{V_{\text{max}} - V_{\text{dc}}}{V_{\text{max}} - V_{\text{dc}} - V_{\text{sw}}} \cdot \frac{V_{\text{dc}}}{f_{\text{sw}}} \tag{Eq. 1}$$

where V_{max} is the maximum load for the output (minimum DCM), V_{dc} is the output drop of the output capacitor (due to the parasitic inductance), and f_{sw} is the switching frequency of the power converter. Choose the primary inductance value to be less than L_{primary} .

Duty Cycle Calculation

The average value of the duty cycle (Davg) for the selected primary inductance L_{primary} can be
