Vertical Aeroponics System Michelle Bates Ph D, 2020-05-22 Aeroponics like hydroponics deals with growing plants without using soil Once soil is taken from the equation all that is left is water air and nutrients The air becomes the growing medium rather than the soil It is then left to me to measure the nutrient solution or the fertilizer being mixed into the water The lid must be secure to block out all light from hitting the roots dangling inside the aeroponic system therefore the humidity will stay at 100 percent while oxygen rich nutrient solution sprays the roots all day For pretty much all of Time plants have been confined to growing in soil and therefore have had to grow horizontally roots down stems and leaves up The advent and popularization of hydroponics changed all that By isolating the nutrients and minerals from the soil and adding them directly into water plants were able to grow freely away from the ground giving rise to the practice of vertical farming By 2050 the world s population is expected to grow by another 2 billion people and feeding it will be a huge challenge Due to industrial development and urbanization we are losing arable lands every day Scientists say that the Earth has lost a third of its arable lands over the last 40 years We don t know how much more we are going to lose in the next 40 years Increasing food demand due to a growing population along with ever decreasing arable lands poses one of the greatest challenges facing us Many believe that vertical farming can be the answer to this challenge

Urban Soils Rattan Lal, B. A. Stewart, 2017-10-18 Globally 30% of the world population lived in urban areas in 1950 54% in 2016 and 66% projected by 2050 The most urbanized regions include North America Latin America and Europe Urban encroachment depletes soil carbon and the aboveground biomass carbon pools enhancing the flux of carbon from soil and vegetation into the atmosphere Thus urbanization has exacerbated ecological and environmental problems Urban soils are composed of geological material that has been drastically disturbed by anthropogenic activities and compromised their role in the production of food aesthetics of residential areas and pollutant dynamics Properties of urban soils are normally not favorable to plant growth the soils are contaminated by heavy metals and are compacted and sealed Therefore the quality of urban soils must be restored to make use of this valuable resource for delivery of essential ecosystem services e.g food water and air quality carbon sequestration temperature moderation biodiversity Part of the Advances in Soil Sciences Series Urban Soils explains properties of urban soils assesses the effects of urbanization on the cycling of carbon nitrogen and water and the impacts of management of urban soils soil restoration urban agriculture and food security evaluates ecosystem services provisioned by urban soils and describes synthetic and artificial soils
