Computational Fluid Dynamics and Energy Modelling in Buildings Parham A. Mirzaei, 2022-11-04 COMPUTATIONAL FLUID DYNAMICS AND ENERGY MODELLING IN BUILDINGS A Comprehensive Overview of the Fundamentals of Heat and Mass Transport Simulation and Energy Performance in Buildings In the first part of Computational Fluid Dynamics and Energy Modelling in Buildings Fundamentals and Applications the author explains the fundamentals of fluid mechanics thermodynamics and heat transfer with a specific focus on their application in buildings This background knowledge sets the scene to further model heat and mass transport in buildings with explanations of commonly applied simplifications and assumptions In the second part the author elaborates how the fundamentals explained in part 1 can be used to model energy flow in buildings which is the basis of all commercial and educational building energy simulation tools An innovative illustrative nodal network concept is introduced to help readers comprehend the basics of

conservation laws in buildings The application of numerical techniques to form dynamic simulation tools are then introduced In general understanding these techniques will help readers to identify and justify their choices when working with building energy simulation tools rather than using default settings Detailed airflow information in buildings cannot be obtained in building energy simulation techniques Therefore part three is focused on introducing computational fluid dynamics CFD as a detailed modelling technique for airflow in buildings This part starts with an introduction to the fundamentals of the finite volume method used to solve the governing fluid equations and the related challenges and considerations are discussed The last chapter of this part covers the solutions to some practical problems of airflow within and around buildings The key aspect of Computational Fluid Dynamics and Energy Modelling in Buildings Fundamentals and Applications is that it is tailored for audiences without extensive past experience of numerical methods Undergraduate or graduate students in architecture urban planning geography architectural engineering and other engineering fields along with building performance and simulation professionals can use this book to gain additional clarity on the topics of building energy simulation and computational fluid dynamics

*Vacuum Bubbling* Yong Du Jun, 2024-05-23 Vacuum Bubbling introduces the background and applications for generating bubbles under a vacuum condition accomplished through depressurization without the need to heat water It presents the advantage of utilizing vapor bubble in deaeration applications because the diffusion for degassing happens between the water body and micro vapor bubbles without the need of membrane or packing Instead of relying on massive heating vacuum bubbling focuses on depressurization down to the level of saturated vapor pressure or below to secure vapor bubbles with virtually zero dissolved non condensable gases including oxygen The book considers prospective applications such as extracting high oxygen content air from water for underwater breathing pretreatment of aircraft fuel before being pumped into a fuel tank system and probable desalination applications through massive bubbling combined with low grade renewable energy The book is intended for researchers in thermal fluids heat and mass transfer process engineering and water treatment fields and industry professionals working in power generation plant and process engineering transportation and energy
