[Introduction to Digital Image Processing](#) William K. Pratt, 2013-09-13 The subject of digital image processing has migrated from a graduate to a junior or senior level course as students become more proficient in mathematical background earlier in their college education With that in mind *Introduction to Digital Image Processing* is simpler in terms of mathematical derivations and eliminates derivations of

Management Information Systems 2000 C. A. Brebbia, P. Pascolo, 2000 Annotation Spanning a broad range of topics including environmental conservation economic planning cartography urban planning risk assessment pollution control and transport management systems this volume includes papers originally presented at the major international Management Information Systems Conference **A Knowledge-based Deformable Surface Model for Analysis of Medical Images** Amir Ghanei, 2001 Medical images are challenging for segmentation Deformable models proved to be one of the most effective tools for this purpose however they still have several shortcomings and face several problems when used for images with objects that have low contrast multiple edges of other objects in their vicinity or do not have a continuous boundary in the image They also suffer in general from problems such as initialization self cutting and concave shape In this research we developed and implemented a two dimensional 2D and three dimensional 3D deformable model for analysis of medical images We used the 2D deformable model to segment structures with low contrast and multiple or discontinuous edges To do this we developed an edge tracking algorithm for external forces adaptive force weights and interpolation of energies We further developed a 2D warping model that uses this deformable contour to extract the boundaries and create a mesh map in each image using equidistance contours Thin plate splines or inverse distance weights are used for interpolation between the mesh map grids We developed a 3D deformable surface model as the extension of the deformable contour to 3D The model has a closed discrete structure based on polygonal facets We developed a method based on LSE estimation of Dupin indicatrix to calculate internal forces and use gradient based operator for external forces We remedy self cutting by extracting principal axis and performing reslicing followed by triangulation of the model We propose a method for creating

the initial surface from the individual 2D contours and use multi resolution and resampling of the surface and re triangulation to further improve the model deformation The model is initialized using a rule based expert system We extended the 2D warping model to 3D The developed models have been used in several challenging applications among which segmentation of hippocampus from brain MRI and prostate from ultrasound images and the warping have been extensively investigated Comparison to manual results shows excellent model performance
