*Signal Processing and Optimisation of MIMO Radar* Luke Anthony Balzan, 2012 This thesis presents a background to and a series of interesting and novel results for a particular proposed model for narrowband MIMO radar systems The proposed model is both novel and unique comprising closely spaced antenna arrays that transmit orthogonally coded waveforms and can be seen as a logical extension to existing models for conventional single input single output radar systems Signal processing and optimisation is performed on the proposed system with a view to yield enhanced estimation and tracking performance The proposed signal and likelihood estimation models have been thoroughly defined with a number of important approximations

and simplifications to the models gained through the use and exploitation of orthogonally coded waveforms All approximations and assumptions have been justified through the use of simulated examples The Cram r Rao bound for the models is derived and verified as correct through the use of simulated data Through comparison of the Cram r Rao bound to statistical estimation variances obtained through extensive simulations the proposed models are shown to be efficient thereby demonstrating the validity of the bound to be used as performance metric for optimisation With the knowledge that the proposed MIMO radar system is efficient the Cram r Rao bound is used as a measure for estimation performance optimisation The bound is seen to be dependent on the choice of orthogonally coded waveforms used in the MIMO radar system and by framing the selection of codes as a convex optimisation problem codes can be chosen to minimise the Cram r Rao bound and since the system has been shown to be efficient this also reduces estimate variance thus improving the estimation performance of the system This optimisation problem has been examined and simulated extensively with simulated data substantiating the claims of performance improvement Finally this thesis explores the idea of tracking for MIMO radar A Kalman filter based tracker is proposed and simulated for the MIMO radar system Extending the convex optimisation scheme discussed above a similar optimisation problem is formed for the case of MIMO radar tracking The optimisation problem has been simulated to select orthogonal codes for transmitting based on the predicted target motion obtained from the Kalman filter tracker By basing the optimisation on the predicted tracker outputs an action perception cycle for MIMO radar is established where the system is able to adapt to its surroundings based on it s current and predicted view of the environment Simulations have been used to observe the performance improvements of implementing the optimisation scheme and thereby showing the action perception cycle for MIMO radar at work **Index to IEEE**

*Evaluation of Coding Scheme for MIMO Radar* Suresh Kumar Harikrishnan,2005 Multiple Input Multiple Output MIMO antenna systems have shown a great potential for wireless communication These systems support high capacity increased diversity and interference suppression Recently it has been proposed MIMO constellations for Radar MIMO Radar is not only a new research field but also a very promising approach in terms of overcoming Radar Cross Section RCS fluctuations with diversity This thesis explores the potential of coding schemes for MIMO Radar The ambiguity functions measures related to MIMO Radar are used to evaluate how much diversity gain can be coherently achieved with certain coding schemes The results of this analysis show that the cross correlation between the signals from different transmitters hinders achieving the full diversity gain The code length of the used Gold codes is an important factor for this effect However in this thesis a coding scheme related to the Alamouti scheme in Communication is presented this scheme under some constraints is capable of maintaining orthogonality between the signals from different transmitters and therefore cancels the mutual interference
