Bayesian Deep Learning Uncertainty In Deep Learning:

Bayesian Deep Learning and Uncertainty in Computer Vision Buu Truong Phan,2019 Visual data contains rich information about the operating environment of an intelligent robotic system Extracting this information allows intelligent systems to reason and decide their future actions Erroneous visual information therefore can lead to poor decisions causing accidents and casualties especially in a safety critical application such as automated driving One way to prevent this is by measuring the level of uncertainty in the visual information interpretation so that the system knows the reliability degree of the extracted information Deep neural networks are now being used in many vision tasks due to their superior accuracy compared to traditional machine learning methods However their estimated uncertainties have been shown to be unreliable To mitigate this issue researchers have developed methods and tools to apply Bayesian modeling to deep neural networks This results in a class of models known as Bayesian neural networks whose uncertainty estimates are more reliable and informative In this thesis we make the following contributions in the context of Bayesian Neural Network applied to vision tasks In particular We improve the understanding of visual uncertainty estimates from Bayesian deep models Specifically we study the behavior of Bayesian deep models applied to road scene image segmentation under different factors such as varying weather depth and occlusion levels We show the importance of model calibration technique in the context of autonomous driving which strengthens the reliability of the estimated uncertainty We demonstrate its effectiveness in a simple object localization task We address the high run time cost of the current Bayesian deep learning techniques We develop a distillation technique based on the Dirichlet distribution which allows us to estimate the uncertainties in real time

Enhancing Deep Learning with Bayesian Inference Matt Benatan,Jochem Gietema,Marian Schneider,2023-06-30 Develop Bayesian Deep Learning models to help make your own applications more robust Key Features Gain insights into the limitations of typical neural networks Acquire the skill to cultivate neural networks capable of estimating uncertainty Discover how to leverage uncertainty to develop more robust machine learning systems Book Description Deep learning has an increasingly significant impact on our lives from suggesting content to playing a key role in mission and safety critical applications As the influence of these algorithms grows so does the concern for the safety and robustness of the systems which rely on them Simply put typical deep learning methods do not know when they don t know The field of Bayesian Deep Learning contains a range of methods for approximate Bayesian inference with deep networks These methods help to improve the robustness of deep learning systems as they tell us how confident they are in their predictions allowing us to take more care in how we incorporate model predictions within our applications Through this book you will be introduced to the rapidly growing field of uncertainty aware deep learning developing an understanding of the importance of uncertainty estimation in robust machine learning systems You will learn about a variety of popular Bayesian Deep Learning methods and how to implement these through practical Python examples covering a range of application scenarios By the end of the book

you will have a good understanding of Bayesian Deep Learning and its advantages and you will be able to develop Bayesian Deep Learning models for safer more robust deep learning systems What you will learn Understand advantages and disadvantages of Bayesian inference and deep learning Understand the fundamentals of Bayesian Neural Networks Understand the differences between key BNN implementations approximations Understand the advantages of probabilistic DNNs in production contexts How to implement a variety of BDL methods in Python code How to apply BDL methods to real world problems Understand how to evaluate BDL methods and choose the best method for a given task Learn how to deal with unexpected data in real world deep learning applications Who this book is for This book will cater to researchers and developers looking for ways to develop more robust deep learning models through probabilistic deep learning You re expected to have a solid understanding of the fundamentals of machine learning and probability along with prior experience working with machine learning and deep learning models   Fully Bayesian Learning and Classic Deep Learning Elio Abi Younes,2020 Classic deep learning algorithms are powerful tools for the construction of accurate predictive models for labeled data However traditional deep neural networks designed to learning such models are both prone to overfitting and incapable of assessing uncertainty In contrast Bayesian learning based upon the emergence of Markov chain Monte Carlo methods and variational inference provides strong ability to express uncertainty in predictions and improve the estimated posterior probability based on new evidence This work further assesses the efficiency and accuracy of Bayesian inference in complex settings We provide an in depth empirical analysis of the methods on both real and synthetic data in the context of regression and image classification Specifically we develop a unified Bayesian deep neural network model interleaving Bayesian sampling into deep learning By rephrasing these learning techniques upon a common theoretical ground casting 1 the application of fully Bayesian learning for deep neural networks rather than pure optimization based or approximate learning and 2 the most significant regularization technique in neural networks dropout as approximate Bayesian inference we perform a clear comparison proving the efficiency of Bayesian deep learning to maintain state of the art performance compared to existing methods while mitigating the problem of uncertainty in deep learning   Mathematical Analysis of Uncertainty in Machine Learning and Deep Learning Takuya Kashimura,2020 In this paper we study uncertainty in machine learning and deep learning from the mathematical point of view Uncertainty is involved in many real world situations The Bayesian modelling can handle such uncertainty in machine learning community However the traditional deep learning model fails to show uncertainty for its outputs Recently at the intersection of the Bayesian modelling and deep learning a new framework called the Bayesian deep learning BDL has been proposed and studied which enables us to estimate uncertainty of deep learning models As an example of it we can review the results of Yarin Gal in which the famous dropout method can be seen as a Bayesian modelling We also see that overfitting problem of the framework due to the property of the KL divergence and review the modified algorithm using o divergence which generalizes the KL divergence We also study a

confidence band to assess uncertainty of a kernel ridge regression estimator We propose the formulation to obtain a confidence band as the convex optimization which enables us to use existing algorithms such as the primal dual inner point method The proposed method acquires a more accurate and fast confidence band than a bootstrap algorithm We also see the effectiveness of our proposed method both in the case of function approximation and an estimate of an actual dataset
