Dc Motor Speed Control Using Pid Controllers:

PID Digital Controller for DC Motor Speed Using MC68HC11 Microcontroller Sharon Peterus,2008 The proportional integral derivative PID controllers are widely used in many industrial control systems for several decades since Ziegler and Nichols proposed their first PID tuning method This is because the PID controller structure is simple and its principle is easier to understand than most other advanced controllers On the other hand the general performance of PID controller is satisfactory in many applications For these reasons the majority of the controllers used in industry are of PI PID type PID controllers are widely used for process control applications requiring very precise and accurate control The purpose of the motor speed controller is to take a signal representing the demanded speed and to drive a motor at that speed The controller does not actually measure the speed of the motor Thus it is called an Open Loop Speed Controller Motors come in a variety of forms and the speed controller s motor drive output will be different dependent on these forms The speed controller presented here is designed to drive special dc motor which is not easily available anywhere in store thus it is a good example to be used due to the special characteristics and parameters Matlab Simulink is an important tool used it this project from designing the mathematical model of the dc motor obtaining the transfer function and designing the PID controller using both model and programming using m files The transfer function will be linearized and used for tuning the gain of PID controller like KP KI and KD Simulink is chosen to simulate the performance of the control system Speed Control of DC Motor Using PID Controller Implementation with Visual Basic Nurul Izzati Pandak Jabo,2008 The project focused on speed control of DC motor The main objective is to design and develop GUI software for speed control experiment where PID controllers design approaches has been applied The controllers have been designed and the system is simulated using MATLAB to analyze their initial performance The computer is connected to DC Motor via data acquisition card DAQ Card and Visual Basic is used to conduct the experiment Field testing is implemented to compare the results between the original and modified system with the PID controller Finally the performance of the system is analyzed and validation is done in terms of time response robustness and percentage of error Control and Information Sciences I. Speed Control of DC Motor Using PID Controller Implementation with PLC Muhammad Ezra-Ezwan Mat Aris, 2008 The idea of motor speed control is to keep the rotation of the motor at the set speed When used in speed applications speed feedback control the DC motor's speed or confirms that the motor is rotating at the desired speed To maintain the speed it requires the speed feedback at all times The objective of this project is to use the algorithm of Proportional Integral Derivative PID controller to control the speed of the DC motor using Programmable Logic Controller PLC implementation The used of PLC in this project will help to reduce complexity and easy to troubleshoot The model of PLC which is used in this project is OMRON CQM1H CPU51 and the program for this controller system is in ladder

diagram CX programmer The PID is implemented in the PLC program so that the system has a better response and less error Finally analysis of the response is made after the PID is implemented into the system

A DC Motor Controller Using PID Algorithm Implementation on PIC Wan Robaah W Ahmad,2008 This project is about controlling the speed of DC servo motor by using Proportional Integral Derivative PID algorithm then implemented on Peripheral Interface Circuit PIC microcontroller The main objective of this project is to control the speed of DC servo motor at the demanded speed or to drive the motor at that speed The speed of a DC motor usually is directly proportional to the supply voltage So if we reduce the supply voltage from 12 Volts to 6 Volts the motor will run at half the speed It could be achieved by simply adjusting the voltage sent to the motor but this is quite inefficient to do So A PID controller becomes the best way to overcome this problem PID attempts to correct the error between a measured process variable and a desired setpoint by calculating and then outputting a corrective action that can adjust the process accordingly In this project the PID algorithm that is added to the system becomes a closed loop system A simulation using MATLAB software is implemented to tune PID algorithm by changing the value of Proportional gain K_p Integral gain K_i and Derivative gain K_d to get a speed of the motor which is less overshoot and increase settling time Then a PIC microcontroller is programmed by adding the value of tuned PID algorithm to control the speed of DC servo motor At the end of the project the speed of the DC servo motor should be maintain even the supply voltage is varied *Emerging Trends in Advanced Science*
