

13. The Logistic Differential Equation

Suppose that $P(t)$ describes the quantity of a population at time t . For example, $P(t)$ could be the number of milligrams of bacteria in a particular beaker for a biology experiment, or $P(t)$ could be the number of people in a particular country at a time t . A model of population growth tells plausible rules for how such a population changes over time. The simplest model of population growth is the **exponential model**, which assumes that there is a constant parameter r , called the **growth parameter**, such that

$$P'(t) = r P(t)$$

holds for all time t . This differential equation itself might be called the **exponential differential equation**, because its solution is

$$P(t) = P_0 e^{rt}$$

where $P_0 = P(0)$ is the initial population.

One noticeable feature of the exponential model is that, when r is positive, the population always grows larger and larger without any finite limit, as is seen in Figure 1. This kind of growth may be a good model for a new population of bacteria in a beaker, but it does not hold for a long time. It is easy to see that the equation would imply a population of bacteria that ultimately outgrew the beaker and even outgrew the planet earth, since the mass of the bacteria would ultimately exceed the mass of the earth. Such a model is therefore absurd to model a system for long periods of time. The fundamental difficulty is that the exponential differential equation ignores the fact that there are limits to resources needed for the population to grow. It ignores the needs for food, oxygen, and space; and it ignores the accumulation of waste products that inevitably arise.

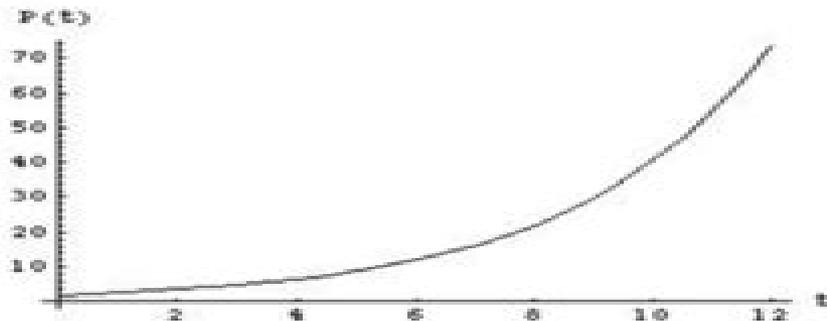

Figure 1 : $P(t) = 2 e^{0.3t}$. This example of the exponential model shows a population growing always faster without any bound.

An alternative model was proposed by Verhulst in 1836 to allow for the fact that there are limits to growth in all known biological systems. He proposed what is now called the **logistic differential equation**. The equation involves two positive parameters. The first parameter r is again called the **growth parameter** and plays a role similar to that of r in the exponential differential equation. The second parameter K is called the **carrying capacity**. The logistic differential equation is written

$$P'(t) = r P(t) [1 - P(t)/K].$$

Equivalently, in terms of the d notation, the logistic differential equation is

$$dP/dt = r P [1 - P / K]$$

as understanding autoimmune diseases However research in this area is hampered by heterogeneity at the cellular and physiological levels making analysis of experimental and clinical data extremely difficult Black box models employed by artificial intelligence while very helpful in data analysis do not provide explanations about these mechanisms and their dynamics On the other hand mathematical models of dynamics of intercellular interactions and intracellular processes provide means to build up and preliminary test hypotheses about regulatory network structure and dynamics at any chosen level Moreover they facilitate simulation based studies of potential treatment protocols thus accelerating advances in clinical practice This Research Topic focuses on mathematical modeling applied to understand uncover and utilize mechanisms involved in immune system responses at intracellular tissue and physiological levels We look forward to novel models supported by experimental and clinical data and bringing biologically or clinically relevant conclusions The Topic s goal is to advance knowledge in this area to be utilized in new development of new molecular targets for future drugs and new therapy protocols Through presenting original conclusions stemming from mathematical analyses it should promote interdisciplinary research linking molecular biologists clinicians and modelers showing benefits of mathematical support in clinically oriented research We welcome researchers to submit Perspectives Original Research articles and Reviews focusing on development and analysis of mathematical models related to immune system dynamics including but not limited to the following subtopics Intracellular signaling pathways and regulatory networks associated with immune responses Cellular responses to viral infections Mechanisms of evading immune response by cancer cells Intercellular interactions associated with immune system response Model based design of immunotherapy protocols Autoimmune diseases dynamics and treatment Please NOTE Manuscripts are required to go beyond showing their alignment with existing data and present analyses that advance knowledge in the area

Dynamics of Continuous, Discrete and Impulsive Systems, 1997 Growth and Diffusion Phenomena Robert B. Banks, 1993-12-22 Diffusion and growth phenomena abound in the real world surrounding us Some examples growth of the world s population growth rates of humans public interest in news events growth and decline of central city populations pollution of rivers adoption of agricultural innovations and spreading of epidemics and migration of insects These and numerous other phenomena are illustrations of typical growth and diffusion problems confronted in many branches of the physical biological and social sciences as well as in various areas of agriculture business education engineering medicine and public health The book presents a large number of mathematical models to provide frameworks for the analysis and display of many of these The models developed and utilized commence with relatively simple exponential logistic and normal distribution functions Considerable attention is given to time dependent growth coefficients and carrying capacities The topics of discrete and distributed time delays spatial temporal diffusion and diffusion with reaction are examined Throughout the book there are a great many numerical examples In addition and most importantly there are more than 50 in depth illustrations of the application of a particular framework or model based on real world problems These

examples provide the reader with an appreciation of the intrinsic nature of the phenomena involved They address mainly readers from the physical biological and social sciences as the only mathematical background assumed is elementary calculus Methods are developed as required and the reader can thus acquire useful tools for planning analyzing designing and evaluating studies of growth transfer and diffusion phenomena The book draws on the author's own hands on experience in problems of environmental diffusion and dispersion as well as in technology transfer and innovation diffusion

Calculus for Cognitive Scientists James K. Peterson, 2016-02-04 This book provides a self study program on how mathematics computer science and science can be usefully and seamlessly intertwined Learning to use ideas from mathematics and computation is essential for understanding approaches to cognitive and biological science As such the book covers calculus on one variable and two variables and works through a number of interesting first order ODE models It clearly uses MatLab in computational exercises where the models cannot be solved by hand and also helps readers to understand that approximations cause errors a fact that must always be kept in mind

Dynamics of Technological Change Louis A. Girifalco, 1991-05-31 Technology is not an end in itself but a way of satisfying human wants It shows us how to solve the age-old economic problem of surviving and prospering in a hard world But to optimize the benefits of technological advance requires an understanding of how it happens The purpose of this book is to provide some of that understanding The subject is so enormous and so intertwined with every human activity that a small selection of it and that from a special viewpoint is inevitable The selection of subject matter has been of course conditioned by what interests me and is somewhat heterogeneous However it is connected by two major themes The first is that it emphasizes the dynamic nature of technology in the sense that it must be approached as a process evolving in time

that can often be described in quantitative terms The second is that I have chosen topics that I believe are essential for a strategic sense of how to plan for execute and respond to technological change These two themes complement each other because the strategic sense requires an appreciation of the dynamics and the dynamics naturally lead to a consideration of how to deal with technology so that it can be used to achieve human objectives The unifying thought behind the book is that technological change has a systemic as well as an idiosyncratic aspect
