Aerospace Sensors Alexander Nebylov,2012-11-20 Modern air and space craft demand a huge variety of sensing elements for detecting and controlling their behavior and operation These sensors often differ significantly from those designed for applications in automobile ship railway and other forms of transportation and those used in industrial chemical medical and other areas This book offers insight into an appropriate selection of these sensors and describes their principles of operation design and achievable performance along with particulars of their construction Drawn from the activities of the International Federation of Automatic Control IFAC especially its Aerospace Technical Committee the book provides details on the majority of sensors for aircraft and many for spacecraft satellites and space probes It is written by an international team of twelve authors representing four countries from Eastern and Western Europe and North America all with considerable experience in aerospace sensor and systems design Highlights include coverage of aerospace vehicle classification specific design criteria and the requirements of onboard systems and sensors reviews of airborne flight parameter sensors weather sensors and collision avoidance devices discussions on the important role of inertial navigation systems INS and separate gyroscopic sensors for aerospace vehicle navigation and motion control descriptions of engine parameter information collection systems including fuel quantity and consumption sensors pressure pickups tachometers vibration control and temperature sensors and descriptions and examples of sensor integration

A Systematic Approach to Sensor Selection for Aircraft Engine Health Estimation National Aeronautics and Space Administration,2019-01-19 A systematic approach for selecting an optimal suite of sensors for on board aircraft gas turbine engine health estimation is presented The methodology optimally chooses the engine sensor suite and the model tuning parameter vector to minimize the Kalman filter mean squared estimation error in the engine s health

parameters or other unmeasured engine outputs This technique specifically addresses the underdetermined estimation problem where there are more unknown system health parameters representing degradation than available sensor measurements This paper presents the theoretical estimation error equations and describes the optimization approach that is applied to select the sensors and model tuning parameters to minimize these errors Two different model tuning parameter vector selection approaches are evaluated the conventional approach of selecting a subset of health parameters to serve as the tuning parameters and an alternative approach that selects tuning parameters as a linear combination of all health parameters Results from the application of the technique to an aircraft engine simulation are presented and compared to those from an alternative sensor selection strategy Simon Donald L and Garg Sanjay Glenn Research Center NASA TM 2009 215839 ISABE 2009 1125 E 17099 **Sensors for Automotive-engine Control** J.
