SL-2120-09AAT-16, BS-1077-2, ASTM D-2013
 Casagrande method in mechanical form is known as liquid limit method and has been in use for soil resistance for a number of decades. The liquid limit data of soils is useful to correlate engineering properties of soil such as compressibility and bearing shear strength. Liquid limit is the water content at which soil passes from stiff strength for an infinite strength, hence the true value of liquid limit cannot be determined by the conventional purpose liquid limit. But water content at which a part of soil, cut by a grooving standard dimensions, will flow together for a distance of 1.00cm under an impact of 25 blows in a standard liquid limit apparatus. The part of soil for the entire range of water content which is about 0.175mm, 0.075 (opening size). An 18mm diameter hole is cut from liquid water to plastic state. It consists an above cup held on an adjustable bracket. The cup can be adjusted for a fall of 1 cm and can be raised an average rate of 1mm/sec. of constant height for 30 times. Complete with grooving standard purpose tool, one 18cm grooving tool and height gauge block.

ASTM D-2478, AASHTO T 170
 Sand equivalent tests serve as rapid field-correlation tests to show relative proportions of clay-like or plastic fines and dust in granular soils and fine aggregates. The test separates sand and clay, a comparison is then made between the sedimented clay and the sediment that is the same size as the test. This can be done in the

laboratory or in the field to increase accuracy and ease of operation compared to a spring-type tester. It is recommended for samples in the laboratory.

The consistent, repeatable oscillation of the apparatus eliminates operator-induced variation. Shaking operation delivers an 8" (203mm) stroke at 10 g force and 1170 g's (1170 strokes per minute). Dimensions: 112.48 x 226.74 (31 x 61 x 171mm).

Plummet Balance (SL-07-014)

ASTM D-2478, AASHTO T 170
 Conventionally particle size distribution analysis is carried out using pipette and hydrometer methods. whereas in hydrometer method it is possible to determine particle sizes in the range 0.0005mm, the method involves coarse sieve and it is slow procedure. The pipette method can be used for determining only the percentage of passing of height of the balance, so that plummet ends to the right depth is required. The percentage of soil in suspension is directly indicated by a pointer over a graduated scale. A vertical rod is mounted on a sliding base having a counter weight. A plunger with curved flange is placed bearing on movement on a graduated scale. Scale graduations are marked 0-100%, 0.1% to the other end of the pointer a plummet is attached. Back and gauge arrangement is provided on the vertical rod for adjusting the height of the plunger with respect to the relationship between "h" and temperature of suspension of soil of varying specific gravity from 2.4 to 2.8 for help in taking density readings. Supplied complete with one 100mm plummet, one counter weight for one size adjustment and side weight for adjusting the pointer to 100%.

Proctor Compaction Test Apparatus (SL-07-015)

ASTM D-2922-01
 Specification test compaction is of utmost requirement for constructing earth fill for dams, canal embankments, reservoirs, highways, runways and airfields. The relationship between soil moisture content and compaction is a primary consideration in the compaction specifications and quality control of compacted earthfills. To check the strength of the soil the density of the soil is taken into account and hence the quality control is checked.
