

How Can Blood Diseases Be Identified?

Blood is a tissue. It has many different cells with many different jobs. If you look at blood under microscope, you will find three different cell types – red cells, white cells, and platelets. In a normal person the numbers of types of blood cells are fairly constant. Sometimes, however, the number of cells will change due to a certain disease. Noticing this change in number can help a physician in the diagnosis of a person's disease.

BACKGROUND – Define the following words:

Diagnosis

Platelet

Red blood cell

White blood cell

PROCEDURE

Part A. Normal Blood Cells

1. Examine Figure 1, which shows human blood cells magnified 1000 times.
2. Count cell type present.
 - a. Red blood cells – round, very numerous, no nucleus
 - b. White blood cells – round, few in number, larger than red blood cells, nucleus present
 - c. Platelets – dotlike, many but less than red cells, very small
3. Record the number of each cell type for Figure 1 in Table 1. These numbers are for normal blood.
4. Using the numbers 1, 2, 3, rank the cells in order from the most common (1) to the least common (3). Enter these rankings in the next column in Table 1 marked Rank.
