

## Chapter 3: Quiz

1.) A bacterial species is discovered that contains thylakoids and carboxysomes. It can be assumed from the presence of these structures that this bacterium

- is pathogenic.
- can orient along Earth's magnetic fields.
- is capable of photosynthesis.
- can attach to a nonliving substrate.

FEEDBACK: The presence of thylakoids (intracellular membranes containing photosynthetic pigments) and carboxysomes (containing carbon-fixation enzymes) suggests that the organism is photosynthetic.

2.) A second, outer membrane is found in

- all organisms.
- all bacteria.
- Gram-negative bacteria.
- Gram-positive bacteria.

FEEDBACK: Not all bacteria have an outer membrane. Gram-negative bacteria have an outer membrane external to the cell wall.

3.) Attractants and repellents are detected by chemoreceptors that can trigger

- different flagella to rotate to change direction toward or away from the source of the attractants or repellents.
- the rotary flagella to change their rotation to allow the bacterium to change direction randomly.
- the flagella to whip in unison.
- different flagella to stop or start to allow cell movement.

FEEDBACK: The rotary flagella turn counterclockwise to move forward and counterclockwise to tumble. When the direction switches back and forth a random walk occurs.

4.) Bacterial cell division differs from eukaryotic cell division in all of the following except

- producing two genetically identical daughter cells.
- having bidirectional replication of the genome.
- initiating a second round of DNA replication before the first round is complete (under some conditions).
- starting at the *ori* site and ending at the *ter* site.

FEEDBACK: The purpose of binary fission and mitosis is to produce new cells with cloned DNA. The process in bacteria can occur bidirectionally due to the genome usually being circular rather than in linear chromosomes, and multiple rounds can occur as no nucleus is present.
