Confectionery and Chocolate Engineering Ferenc A. Mohos, 2010-11-29 Confectionery and chocolate manufacture has been dominated by large scale industrial processing for several decades It is often the case though that a trial and error approach is applied to the development of new products and processes rather than verified scientific principles The purpose of this book is to describe the features of unit operations used in confectionary manufacturing In contrast to the common technology focused approach to this subject this volume offers a scientific theoretical account of confectionery manufacture building on the scientific background of chemical engineering The large diversity of both raw materials and end products in the confectionery industry makes it beneficial to approach the subject in this way The industry deals with a variety of vegetable based raw materials as well as milk products eggs gelatin and other animal based raw materials A study of confectionery and chocolate engineering must therefore examine the physical and chemical as well as the biochemical and microbiological properties of the processed materials By characterizing the unit operations of confectionery manufacture the author who has over 40 years experience in confectionery manufacture aims to open up new possibilities for improvement relating to increased efficiency of operations the use of new materials and new applications for traditional raw materials The book is aimed at food engineers scientists technologists in research and industry as well as graduate students on relevant food and chemical engineering related courses

Chemical Engineering Dynamics,

Includes CD-ROM John Ingham,2007 In this book the modelling of dynamic chemical engineering processes is presented in a highly understandable way using the unique combination of simplified fundamental theory and direct hands on computer simulation The mathematics is kept to a minimum and yet the nearly 100 examples supplied on www.wiley.vch.de illustrate almost every aspect of chemical engineering science Each example is described in detail including the model equations They are written in the modern user friendly simulation language Berkeley Madonna which can be run on both Windows PC and Power Macintosh computers Madonna solves models comprising many ordinary differential equations using very simple programming including arrays It is so powerful that the model parameters may be defined as sliders which allow the effect of their change on the model behavior to be seen almost immediately Data may be included for curve fitting and sensitivity or multiple runs may be performed The results can be seen simultaneously on multiple graph windows or by using overlays The resultant learning effect of this is tremendous The examples can be varied to fit any real situation and the suggested exercises provide practical guidance The extensive experience of the authors both in university teaching and international courses is reflected in this well balanced presentation which is suitable for the teacher the student the chemist or the engineer This book provides a greater understanding of the formulation and use of mass and energy balances for chemical engineering in a most stimulating manner This book is a third edition which also includes biological environmental and food process examples

Oil Refineries in the 21st Century Ozren Ocic,2008-07-15 A very detailed workable approach to improving energy efficiency and cost effectiveness in petroleum processing dealing with the role of management and refinery operators in achieving the best technological parameters the most rational utilization of energy as well as the greatest possible economic success The author provides a detailed and well founded approach to the methodology information and criteria necessary for analyzing energy use economics and the environmental impact as well as solutions for fulfilling the requirements of the Kyoto agreement In addition he describes in sufficient detail the energy streams within a refinery A practical guide for refinery engineers managers and consultants as well as all engineers involved in the design of process technologies in developed as well as developing countries

Macromolecular Chemistry and Physics ,2006 Innovative Materials for Energy and Sustainability Carlton A. Taft,Sergio Ricardo de Lazaro,2026-01-14 This book presents recent advances in the development and application of innovative materials for sustainable energy and environmental solutions It explores the synthesis characterization and performance of nanomaterials semiconductors and functional composites in technologies such as solar cells microbial fuel cells and photocatalytic systems Special attention is given to environmentally focused applications including biomass conversion pyrite beneficiation and antimicrobial coatings By bridging materials science with energy and environmental engineering the book offers researchers and practitioners valuable insights into emerging strategies for clean energy generation and ecological remediation
