Four-Coil Wireless Power Transfer Using Resonant Inductive Coupling Sravan Annam,2012 **Compact Size Wireless Power Transfer Using Defected Ground Structures** Sherif Hekal,Ahmed Allam,Adel B. Abdel-Rahman,Ramesh K. Pokharel,2019-05-29 This book addresses the design challenges in near field wireless power transfer WPT systems such as high efficiency compact size and long transmission range It presents new low profile designs for the TX RX structures using different shapes of defected ground structures DGS like H semi H and spiral strips DGS Most near field WPT systems depend on magnetic resonant coupling MRC using 3 D wire loops or helical antennas which are often bulky This in turn poses technical difficulties in their application in small electronic devices and biomedical implants To obtain compact structures printed spiral coils PSCs have recently emerged as a candidate for low profile WPT systems However most of the MRC WPT systems that use PSCs have limitations in the maximum achievable efficiency due to the feeding method Inductive feeding constrains the geometric dimensions of the main transmitting TX receiving RX resonators which do not achieve the maximum achievable unloaded quality factor This book will be of interest to researchers and professionals working on WPT related problems

Characterization of Resonant Coupled Inductor in a Wireless Power Transfer System Alan Nebrida,2022-09-08 Research Paper postgraduate from the year 2022 in the subject Engineering Industrial Engineering and Management language English abstract This research project uses resonant inductive coupling to transfer power wirelessly It uses a low power supply to transmit power The scope of this study is limited to the construction of a simplified WPT system using a resonant coupled inductor system This study includes the matching sections derivation of relationship between the coupling coefficient and distance and the parameters quality factor coupling coefficients mutual inductance resonance frequency of the resonators The researcher uses a 12V 5W CYD LED bulb as the load to be able to distinguish easily whether the system is operating well or not This study will not cover other possible methods in improving the efficiency of a wireless power Wireless power transfer based on coupled magnetic resonances is a new technology in which energy can be transferred via coupled magnetic resonances in the non radiative near field This paper presents the design simulation fabrication and experimental characterization of a single loop inductor that acts as the receiver and transmitter of the system A circuit model is presented to provide a convenient reference for the analysis of the transfer characteristics of a magnetically coupled resonator system Based on this structure the output voltage in the receiving loop is related to different transfer distances and orientations A given driving frequency was simulated and analyzed The driving resonant frequency of the system is approximately 580 kHz

Elisenda Bou Balust,2017 Resonant Inductive Coupling Wireless Power Transfer RIC WPT has been proven to provide very

high power transfer efficiencies above 80% for moderate distances and is hence foreseen as a key technology to enable wireless power transfer to a myriad of different devices and related applications. Due to the multidisciplinary nature of the WPT underlying principles, several approaches have been provided to analyze RIC WPT systems from different perspectives encompassing Electromagnetic fields, Circuit models and Optics, but they have failed to provide a unified model to understand and ultimately to design the behaviour of such systems. This thesis is therefore aimed to first provide a multi-modal RIC WPT complete model oriented to the design and in turn optimisation of RIC WPT systems and secondly to explore and characterize the fundamental challenges precluding the widespread deployment of RIC WPT and thereby accordingly to yield a set of design guidelines to overcome them. Finally and due to the fact that multi-node RIC WPT systems are key to the adoption of this technology, this thesis models, characterizes and analyzes Multiple Input Multiple Output RIC WPT Systems, making special emphasis on their scalability.

Excerpt: Nikola Tesla, Serbian Cyrillic 10 July 1856 – 7 January 1943, was a Serbian American inventor, electrical engineer, mechanical engineer, physicist, and futurist, best known for his contributions to the design of the modern alternating current (AC) electricity supply system. Tesla started working in the telephony and electrical fields before emigrating to the United States in 1884 to work for Thomas Edison. He soon struck out on his own with financial backers, setting up laboratories and companies to develop a range of

electrical devices His patented AC induction motor and transformer were licensed by George Westinghouse who also hired Tesla as a consultant to help develop a power system using alternating current Tesla is also known for his high voltage high frequency power experiments in New York and Colorado Springs which included patented devices and theoretical work used in the invention of radio communication for his X ray experiments and for his ill fated attempt at intercontinental wireless transmission in his unfinished Wardencllyffe Tower project Tesla s achievements and his abilities as a showman demonstrating his seemingly miraculous inventions made him world famous Although he made a great deal of money from his patents he spent a lot on numerous experiments over the years In the last few decades of his life he ended up living in diminished circumstances as a recluse in Room 3327 of the New Yorker Hotel occasionally making unusual statements to the press Because
