**Building a Columnar Database on RAMCloud** Christian Tinnefeld, 2015-07-07 This book examines the field of parallel database management systems and illustrates the great variety of solutions based on a shared storage or a shared nothing architecture Constantly dropping memory prices and the desire to operate with low latency responses on large sets of data paved the way for main memory based parallel database management systems However this area is currently dominated by the shared nothing approach in order to preserve the in memory performance advantage by processing data locally on each server The main argument this

book makes is that such an unilateral development will cease due to the combination of the following three trends a Today s network technology features remote direct memory access RDMA and narrows the performance gap between accessing main memory on a server and of a remote server to and even below a single order of magnitude b Modern storage systems scale gracefully are elastic and provide high availability c A modern storage system such as Stanford s RAM Cloud even keeps all data resident in the main memory Exploiting these characteristics in the context of a main memory based parallel database management system is desirable The book demonstrates that the advent of RDMA enabled network technology makes the creation of a parallel main memory DBMS based on a shared storage approach feasible [Fast and Scalable Cloud Data Management](#) Felix Gessert,Wolfram Wingerath,Norbert Ritter,2020-05-15 The unprecedented scale at which data is both produced and consumed today has generated a large demand for scalable data management solutions facilitating fast access from all over the world As one consequence a plethora of non relational distributed NoSQL database systems have risen in recent years and today s data management system landscape has thus become somewhat hard to overlook As another consequence complex polyglot designs and elaborate schemes for data distribution and delivery have become the norm for building applications that connect users and organizations across the globe but choosing the right combination of systems for a given use case has become increasingly difficult as well To help practitioners stay on top of that challenge this book presents a comprehensive overview and classification of the current system landscape in cloud data management as well as a survey of the state of the art approaches for efficient data distribution and delivery to end user devices The topics covered thus range from NoSQL storage systems and polyglot architectures backend over distributed transactions and Web caching network to data access and rendering performance in the client end user By distinguishing popular data management systems by data model consistency guarantees and other dimensions of interest this book provides an abstract framework for reasoning about the overall design space and the individual positions claimed by each of the systems therein Building on this classification this book further presents an application driven decision guidance tool that breaks the process of choosing a set of viable system candidates for a given application scenario down into a straightforward decision tree [Oracle Database 12c Release 2 Real Application Clusters Handbook: Concepts, Administration, Tuning & Troubleshooting K.](#)

**High Availability and Disaster Recovery for Temenos T24 with IBM DB2 and AIX** Barrie Mike, Moditha Sanjay De Costa, Gowrimani Gopalakrishnan, Murali Neralla, IBM Redbooks, 2012-10-09. The Temenos T24 core banking application is a critical application for the banks that use it and has a primary focus on providing an appropriate level of high availability and disaster recovery. The level of availability is determined largely by the configuration of the infrastructure that supports T24. This infrastructure is built on hardware, middleware, and networking in addition to the operational procedures and practices that are used to operate T24. Many options are available for meeting a client's high availability and disaster recovery requirements. The solution chosen by a Temenos T24 user depends on many factors. These factors include a user's detailed availability and recovery requirements, their existing datacenter standards, practices, and processes, and the available network infrastructure. Therefore, the optimum solution must be determined on a case-by-case basis for each deployment. This IBM Redpaper™ publication serves as a guide to help IT architects and other technical staff who are designing, configuring, and building the infrastructure to support Temenos T24. It shows how IBM software can deliver high availability and disaster recovery for Temenos T24 to meet a client's requirements. This software might run on IBM AIX, IBM WebSphere Application Server, WebSphere MQ Server, and IBM DB2. These IBM software components are typically used for a Temenos T24 deployment on an IBM middleware stack to ensure a highly available infrastructure for T24.
