Distributed Constraint Problem Solving and Reasoning in Multi-agent Systems Weixiong Zhang, Volker Sorge, 2004 Distributed and multi agent systems are becoming more and more the focus of attention in artificial intelligence research and have already found their way into many practical applications An important prerequisite for their success is an ability to flexibly adapt their behavior via intelligent cooperation Successful reasoning about and within a multiagent system is therefore paramount to achieve intelligent behavior Distributed Constraint Satisfaction Problems DCSPs and Distributed Constraint Optimization minimization Problems DCOPs are perhaps ubiquitous in distributed systems in dynamic environments Many important problems in distributed environments and systems such as action coordination task scheduling and resource allocation can be formulated and solved as DCSPs and DCOPs Therefore techniques for solving DCSPs and DCOPs as well as strategies for automated reasoning in distributed systems are indispensable tools in the research areas of distributed and multi agent systems They also provide promising frameworks to deal with the increasingly diverse range of distributed real world problems emerging from the fast evolution of communication technologies The volume is divided in two parts One part contains papers on distributed constraint problems in multi agent systems The other part presents papers on Agents and Automated Reasoning

Principles of Distributed Systems Vijay K. Garg, 2012-12-06 Distributed computer systems are now widely available but despite a number of recent advances the design of software for these systems remains a challenging task involving two main difficulties the absence of a shared clock and the absence of a shared memory The absence of a shared clock means that the concept of time is not useful in distributed systems The absence of shared memory implies that the concept of a state of a distributed system also needs to be redefined These two important concepts occupy a major portion of this book Principles of Distributed Systems describes tools and techniques that have been successfully applied to tackle the problem of global time and state in distributed systems The author demonstrates that the concept of time can be replaced by that of causality and clocks can be constructed to provide causality information The problem of not having a global state is alleviated by developing efficient algorithms for detecting properties and computing global functions The author's major emphasis is in developing general mechanisms that can be applied to a variety of problems For example instead of discussing algorithms for standard problems such as termination detection and deadlocks the book discusses algorithms to detect general properties of a distributed computation Also included are several worked examples and exercise problems that can be used for individual practice and classroom instruction Audience Can be used to teach a one semester graduate course on distributed systems Also an invaluable reference book for researchers and practitioners working on the many different aspects of distributed systems
