Untangling the Double Helix James C. Wang, 2009 The problem of unraveling two intertwined strands during the duplication of DNA was recognized shortly after the proposal of the DNA double helix structure in 1953 A group of enzymes called DNA topoisomerases solves this problem by breaking and rejoining DNA molecules allowing strands to be passed through each other and thus be untangled and not just during DNA replication but during many other basic cellular processes as well The critical functions played by topoisomerases and their transient cleavage of intracellular DNA also account for their being the targets for many antibiotics including Cipro and anticancer agents
