

The background of the cover features several stylized neurons. Each neuron has a central cell body (soma) and multiple branching processes (dendrites and axons) extending outwards. The cell bodies are rendered in a light blue or white color, while the axons are thin, light-colored lines. At the ends of many axons, there are small, glowing yellow-orange tips, suggesting synaptic terminals or active zones. The neurons are scattered across the dark background, with some appearing more prominent than others. The overall aesthetic is scientific and modern.

Developmental Neurobiology Greg Lemke,2010-05-22 Developmental Neuroscience is one of the six core disciplines in Neuroscience and yet no single volume non textbook reference exists on the market that provides researchers with more in depth high level information on developmental neurobiology Currently anyone interested in the field at a higher level must sift through review articles published frequently and the more specific handbooks that focus on aspects of development rather than the field as a whole This reference is the first of its kind to fill this need It pulls together the relevant articles on the topic from the 10 volume Encyclopedia of Neuroscience Academic Press 2008 and serves as an affordable and immediate resource for scientists postdocs graduate students with an interest beyond the basic textbook materials on the subject The first and only comprehensive single volume reference for developmental neuroscience that goes beyond the basic textbook information The 93 chapters cover topics ranging from cell fate determination path finding synapse generation neural stem cells to neurodegeneration and regeneration carefully selected from the Encyclopedia of Neuroscience by one of the great developmental neuroscientists Greg Lemke The best researchers in the field provide their conclusions in the context of the latest experimental results *Developmental Cognitive Neuroscience: An Introduction* Mark Johnson,1997-01-01

Developmental cognitive neuroscience is concerned with the relation between the growing brain and the development of mental processes Bringing together recent advances in molecular biology neural networks and brain imaging this interdisciplinary field is rapidly expanding and offers a cohesive account of the construction of the human mind This book is the first comprehensive single authored introduction to the field and reviews the current state of knowledge in the context of an integrative theoretical framework within which the plasticity and maturation of the brain are analysed A central theme of the book is that while there is no evidence of innate cognitive representations in the cortex the type and location of representation that subsequently emerge are constrained by several factors both intrinsic and extrinsic to the infant Further the elongated postnatal development of the human brain reveals a differential development of neural architecture that can be used to make predictions about sequences of cognitive development The book also outlines a number of avenues for future research *American Journal of Mental Retardation* ,1996 Includes the association s conference proceedings and addresses
