Data Analytics Shuai Huang, Houtao Deng, 2021-04-15 Data Analytics A Small Data Approach is suitable for an introductory data analytics course to help students understand some main statistical learning models It has many small datasets to guide students to work out pencil solutions of the models and then compare with results obtained from established R packages Also as data science practice is a process that should be told as a story in this book there are many course materials about

exploratory data analysis residual analysis and flowcharts to develop and validate models and data pipelines The main models covered in this book include linear regression logistic regression tree models and random forests ensemble learning sparse learning principal component analysis kernel methods including the support vector machine and kernel regression and deep learning Each chapter introduces two or three techniques For each technique the book highlights the intuition and rationale first then shows how mathematics is used to articulate the intuition and formulate the learning problem R is used to implement the techniques on both simulated and real world dataset Python code is also available at the book s website <http://dataanalyticsbook.info>

Probabilistic Graphical Models Daphne Koller,Nir Friedman,2009-07-31 A general framework for constructing and using probabilistic models of complex systems that would enable a computer to use available information for making decisions Most tasks require a person or an automated system to reason to reach conclusions based on available information The framework of probabilistic graphical models presented in this book provides a general approach for this task The approach is model based allowing interpretable models to be constructed and then manipulated by reasoning algorithms These models can also be learned automatically from data allowing the approach to be used in cases where manually constructing a model is difficult or even impossible Because uncertainty is an inescapable aspect of most real world applications the book focuses on probabilistic models which

make the uncertainty explicit and provide models that are more faithful to reality Probabilistic Graphical Models discusses a variety of models spanning Bayesian networks undirected Markov networks discrete and continuous models and extensions to deal with dynamical systems and relational data For each class of models the text describes the three fundamental cornerstones representation inference and learning presenting both basic concepts and advanced techniques Finally the book considers the use of the proposed framework for causal reasoning and decision making under uncertainty The main text in each chapter provides the detailed technical development of the key ideas Most chapters also include boxes with additional material skill boxes which describe techniques case study boxes which discuss empirical cases related to the approach described in the text including applications in computer vision robotics natural language understanding and computational biology and concept boxes which present significant concepts drawn from the material in the chapter Instructors and readers can group chapters in various combinations from core topics to more technically advanced material to suit their particular needs

New Directions in Statistical Signal Processing Simon S. Haykin, 2007 Leading researchers in signal processing and neural computation present work aimed at promoting the interaction and cross fertilization between the two fields Signal processing and neural computation have separately and significantly influenced many disciplines but the cross fertilization of the two fields has begun only recently Research now shows that each has much to teach the other as we see highly sophisticated kinds of signal processing and elaborate hierarchical levels of neural computation performed side by side in the brain In *New Directions in Statistical Signal Processing* leading researchers from both signal processing and neural computation present new work that aims to promote interaction between the two disciplines The book's 14 chapters almost evenly divided between signal processing and neural computation begin with the brain and move on to communication signal processing and learning systems They examine such topics as how computational models help us understand the brain's information processing how an intelligent machine could solve the cocktail party problem with active audition in a noisy environment graphical and network structure modeling approaches uncertainty in network communications the geometric approach to blind signal processing game theoretic learning algorithms and observable operator models OOMs as an alternative to hidden Markov models HMMs
