**Nowcasting in Chatbot Design**

Yang Wang, 2020

The rise of intelligent conversation agents or chatbots are responsible for the dramatic decrease in remote customer service agent jobs. However, chatbots in their current form are far from infallible. We theorize that there is an inherent trade off between a chatbot's response relevance and conversational efficiency in the standard knowledge bank architecture. Knowledge bank size increases the relevance of successfully queried results but also increases the difficulty of disambiguating user intents. This inherent trade off leads to the development of unintelligent fail safe artifacts such as user confirmations. We argue that in order to improve user experience and satisfaction we must decouple knowledge bank size

from conversational efficiency To achieve this we first design a new artifact that we dub the sequential FAQ sFAQ and then evaluate its causal impact on user satisfaction An sFAQ uses machine learning techniques to first discover common user service journey patterns then leverage these learned patterns to predict likely subsequent inputs given any focal sequence of inputs We show that by proactively suggesting potential questions to the user we can reduce the need for natural language input and thus reduce the need to disambiguate user intent We then use a novel application of regression discontinuity design RDD to study the causal impact of the eliminated reconfirmation dialogues on user satisfaction Combined we are able to demonstrate that by eliminating the unintelligent fail safe artifacts such as user confirmations the sFAQ will increase satisfaction Our approach of combining predictive machine learning and causal econometric analysis enables us to open the black box for the underlying causal mechanism linking sFAQ and user satisfaction This kind of mechanism identification would not be possible even with experimental testing in the field Our methods and results have useful implications for chatbot applications and user interface design science
