Handbook of Tissue Optical Clearing Valery V. Tuchin, Dan Zhu, Elina A. Genina, 2022-02-08 Biomedical photonics is currently one of the fastest growing fields connecting research in physics optics and electrical engineering coupled with medical and biological applications. It allows for the structural and functional analysis of tissues and cells with resolution and contrast unattainable by any other methods. However, the major challenges of many biophotonics techniques are associated with the need to enhance imaging resolution even further to the sub-cellular level as well as translate them for in vivo studies. The tissue optical clearing method uses immersion of tissues into optical clearing agents (OCAs) that reduces the scattering of tissue and makes tissue more transparent, and this method has been successfully used ever since. This book is a self-contained introduction to tissue optical clearing, including the basic principles and in vitro biological applications, from in vitro to in vivo tissue optical clearing methods and combination of tissue optical clearing and various optical imaging for diagnosis. The chapters cover a wide range of issues related to the field of tissue optical clearing: mechanisms of tissue optical clearing in vitro and in vivo, traditional and innovative optical clearing agents, recent achievements in optical clearing of different tissues including pathological tissues and blood for optical imaging, diagnosis, and therapy. This book provides a comprehensive account of the latest research and possibilities of utilizing optical clearing as an instrument for improving the diagnostic effectiveness of modern optical diagnostic methods. The book is addressed to biophysicist researchers, graduate students, and postdocs of biomedical specialties, as well as biomedical engineers and physicians interested in the development and application of optical methods in medicine. Key features: The first collective reference to collate all known knowledge on this topic. Edited by experts in the field with chapter contributions from subject area specialists. Brings together the two main approaches in immersion optical clearing into one cohesive book. **Catalog of Copyright Entries, Third Series** Library of Congress, Copyright Office, 1965. Over the past two decades, the use of fiber lasers in engineering applications has gradually become established as an engineering discipline on its own. The development of fiber lasers is mainly the result of studies from various domains like photonics, optical sensing, fiber optics, nonlinear optics, and telecommunication. Though many excellent books exist on each of these subjects and several have been written specifically to address lasers and fiber lasers, it is still difficult to find one book where the diverse core of subjects that are central to the study of fiber laser systems are presented in a simple and straightforward way. *Fiber Lasers: Fundamentals with MATLAB Modelling* is an introduction to the fundamentals of fiber lasers. It provides clear explanations of physical concepts supporting the field of fiber lasers. Fiber lasers characteristics are analyzed theoretically through simulations derived from numerical models. The authors cover fundamental principles involved in the generation of laser light through both continuous wave (CW) and pulsing. It also covers

experimental configuration and characterization for both CW and Q switching The authors describe the simulation of fiber laser systems and propose numerical modelling of various fiber laser schemes MATLAB modelling and numerical computational methods are used throughout the book to simulate different fiber laser system configurations This book will be highly desirable and beneficial for both academics and industry professionals to have ample examples of fiber laser approaches that are well thought out and fully integrated with the subjects covered in the text This book is written to address these needs
