
Modeling Low Impact Development Alternatives with SWMM

Lewis A. Rossman

The U.S. Environmental Protection Agency's Office of Water is actively promoting the use of low impact development (LID) practices to help protect and restore water quality in urban and developing areas. Such practices support the concepts of green infrastructure and sustainability by managing stormwater close to its source so as to mimic a site's predevelopment hydrology. Computational tools are needed to objectively evaluate the hydrologic benefits of proposed LID controls. The Storm Water Management Model (SWMM) is one such tool that provides an attractive framework for modeling the long term performance of LID controls. However the latest version of SWMM (Rossman, 2008) has only a limited capability to rigorously model LID alternatives (Huber et al., 2006).

This chapter describes how SWMM's runoff engine and graphical user interface were extended to explicitly model specific types of LID controls, such as permeable pavement, bio-retention areas (e.g., rain gardens and street planters), rain barrels, infiltration trenches, and vegetative swales (see Figure 11.1). Each of these controls is represented as a unique LID object with its own set of properties. These objects can be placed within standard SWMM subcatchment areas in replicate fashion. Or they can occupy their own unique subcatchments that can be linked together to form a cascading sequence of LID controls. Time-dependent water balance models are used to describe the hydrologic performance of each individual LID unit. Several examples are used to illustrate how this approach was implemented within SWMM 5.

Computer-Aided Modelling of Stormwater Systems Bartosz Szeląg, Adam Kiczko, Grzegorz Łagód, Marek Sokáč, Yvetta Velísková, Cecilia Bruni, Francesco Fatone, 2025-11-26 Computer Aided Modelling of Stormwater Systems deals with the construction of probabilistic models of rainfall and their use in the sizing of retention tanks The book discusses methods of sensitivity and uncertainty analysis of hydrodynamic models of urban catchments as well as proprietary calculation algorithms for the sizing of retention tanks considering the uncertainty of calibrated parameters and the variability of outflow hydrographs from the catchment and shape parameters This is important from the point of view of contemporary hydrology of urban catchments because it is the reliability of the identified parameters and their appropriate selection that determines the developed hydrodynamic model of the catchment so that it finds a practical application in sewage network management Also included are innovative graphical and analytical methods of tanks sizing whereby the shapes of hydrographs of the outflow from the catchment area are considered which is omitted in most of the methods used Hybrid models which are a combination of graphical and analytical methods with probabilistic models of rainfall are also presented which makes it possible to shorten the calculation time Finally the ability to implement computational algorithms in the field of sensitivity and uncertainty analysis can also be used when analysing catchments with implemented green infrastructure facilities Computer Aided Modelling of Stormwater Systems is aimed at doctoral students research workers and engineers as an introduction to modern methods of modelling stormwater and combined sewer networks together with the objects located on it such as retention tanks The Open Access version of this book available at <http://www.taylorfrancis.com> has been made available under a Creative Commons Attribution Non Commercial No Derivatives CC BY NC ND 4.0 license
