

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Dynamic gaskets are generally used to seal and support the cylinder, the combustion chamber and the valve in a cylinder or other component. These gaskets have a groove which distributes seal stress in a groove with an application on all three and high compressions used to increase the gasket. A gasket is used to maintain the pressure in a cylinder and to prevent leakage throughout the life cycle application. The gasket compresses to fill the irregularities between the mating surfaces of the cylinder. This is done by creating a seal between the gasket and the cylinder. The gasket is used to maintain the seal between the mating surfaces. If the gasket is not installed correctly, the gasket will be damaged and the seal will be lost. The application of the gasket is to seal the cylinder.

In order to determine the application of the gasket, the gasket designer is required to determine the gasket to be used in a certain case. Every gasket application is unique and every application requires that the gasket be selected to provide the performance of which the gasket is an expert in the application.
