- 1** If agree: It is true that biofuel comes from plants that have only just taken the carbon they contain from the atmosphere. When the next crop is grown the following year, the carbon emitted when the biofuel is burned will be taken in again by this next crop. [1] So, within 2 years carbon in will equal carbon out. [1]
If disagree: While all the above is true, the land used for growing these crops could be used for growing food, [1] which is in short supply in large areas of the world. [1]
- 2** All ecosystems (except those in the deep sea) rely on organic chemicals, mainly sugars, for their continuation. [1] These substances are made in photosynthesis using light from the Sun [1] that is trapped by chlorophyll. [1]
- 3** **a** Between 150 and 20 years ago there was a huge reduction in area of wetland. No wetland was found in the south 20 years ago. The biggest loss was in the east. [1] Between 20 years ago and today there has been a slight increase. [1] One area has re-appeared in the south [1] and the western area has nearly doubled in size. [1]
- 4** The fact that they eat the same food suggests that they may compete [1] for it when together. [1] Species A is clearly more adapted to living in colder water than B. [1] So, when they are together B outcompetes A in the warmer water regions and is the only one when found there. [1]
