Nonlinear Programming Dimitri Bertsekas, 2016-09-01 This book provides a comprehensive and accessible presentation of algorithms for solving continuous optimization problems It relies on rigorous mathematical analysis but also aims at an intuitive exposition that makes use of visualization where possible It places particular emphasis on modern developments and their widespread applications in fields such as large scale resource allocation problems signal processing and machine learning The 3rd edition brings the book in closer harmony with the companion works Convex Optimization Theory Athena Scientific 2009 Convex Optimization Algorithms Athena Scientific 2015 Convex Analysis and Optimization Athena Scientific 2003 and Network Optimization Athena Scientific 1998 These works are complementary in that they deal primarily with convex possibly nondifferentiable optimization problems and rely on convex analysis By contrast the nonlinear programming book focuses primarily on analytical and computational methods for possibly nonconvex differentiable problems It relies primarily on calculus and variational analysis yet it still contains a

detailed presentation of duality theory and its uses for both convex and nonconvex problems This on line edition contains detailed solutions to all the theoretical book exercises Among its special features the book Provides extensive coverage of iterative optimization methods within a unifying framework Covers in depth duality theory from both a variational and a geometric point of view Provides a detailed treatment of interior point methods for linear programming Includes much new material on a number of topics such as proximal algorithms alternating direction methods of multipliers and conic programming Focuses on large scale optimization topics of much current interest such as first order methods incremental methods and distributed asynchronous computation and their applications in machine learning signal processing neural network training and big data applications Includes a large number of examples and exercises Was developed through extensive classroom use in first year graduate courses

Connective Real  $K$ -Theory of Finite Groups Robert Ray Bruner, John Patrick Campbell Greenlees, 2010 This book is about equivariant real and complex topological  $K$  theory for finite groups Its main focus is on the study of real connective  $K$  theory including  $ko$  BG as a ring and  $ko\_BG$  as a module over it In the course of their study the authors define equivariant versions of connective  $KO$  theory and connective  $K$  theory with reality in the sense of Atiyah which give well behaved Noetherian uncompleted versions of the theory They prove local cohomology and completion theorems for these theories giving a means of calculation as well as establishing their formal credentials In passing from the complex to the real theories in the connective case the authors describe the known failure of descent and explain how the eta Bockstein spectral sequence provides an effective substitute This formal framework allows the authors to give a systematic calculation scheme to quantify the expectation that  $ko$  BG should be a mixture of representation theory and group cohomology It is characteristic that this starts with  $ku$  BG and then uses the local cohomology theorem and the Bockstein spectral sequence to calculate  $ku\_BG$   $ko$  BG and  $ko\_BG$  To give the skeleton of the answer the authors provide a theory of  $ko$  characteristic classes for representations with the Pontrjagin classes of quaternionic representations being the most important Building on the general results and their previous calculations the authors spend the bulk of the book giving a large number of detailed calculations for specific groups cyclic quaternion dihedral  $A_4$  and elementary abelian 2 groups The calculations illustrate the richness of the theory and suggest many further lines of investigation They have been applied in the verification of the Gromov Lawson Rosenberg conjecture for several new classes of finite groups This book is about equivariant real and complex topological  $K$  theory for finite groups Its main focus is on the study of real connective  $K$  theory including  $ko$  BG as a ring and  $ko\_BG$  as a module over it In the course of their study the authors define equivariant versions of connective  $KO$  theory and connective  $K$  theory with reality in the sense of Atiyah which give well behaved Noetherian uncompleted versions of the theory They prove local cohomology and completion theorems for these theories giving a means of calculation as well as establishing their formal credentials In passing from the complex to the real theories in the connective case the authors describe the known failure of descent and explain how the eta Bockstein spectral sequence provides an effective substitute This formal framework allows the authors to give a systematic calculation scheme to quantify the expectation that  $ko$  BG should be a mixture of representation theory and group cohomology It is characteristic that this starts with  $ku$  BG and then uses the local

cohomology theorem and the Bockstein spectral sequence to calculate  $ku_{-BG}$  and  $ko_{-BG}$ . To give the skeleton of the answer the authors provide a theory of  $ko$  characteristic classes for representations with the Pontrjagin classes of quaternionic representations being the most important. Building on the general results and their previous calculations the authors spend the bulk of the book giving a large number of detailed calculations for specific groups: cyclic, quaternion dihedral  $A_4$  and elementary abelian 2 groups. The calculations illustrate the richness of the theory and suggest many further lines of investigation. They have been applied in the verification of the Gromov Lawson Rosenberg conjecture for several new classes of finite groups.
