Chromatography is used to identify substances in a sample. In this experiment, the primary/visible pigments of a green sample are separated into bands of colour by paper chromatography. The separation pattern of coloured pigments will depend on their solubility.

These were the best results obtained by my group. The Rf value was the calculated because I did not have time.

The results were not as expected this could be because instead of acetone we changed acetone to propanone therefore the number of drops needed for optimum results could've changed.

The method I was using the size of the sample of leaf was not specified therefore that could have also affected

The results.

Should have not let the paper touch the sides

Make sure the bung and these should be the same size as the chromatography paper

Pin the chromatography paper to the bung with a drawing pin so that the chromatography paper stands up straight
